# Intended Readers

**Typographical Conventions**

**Notes, Notices and Cautions**

**Safety Instructions**

**General Precautions for Rack-Mountable Products**

**Protecting Against Electrostatic Discharge**

The **DGS-3420 Series Web UI Reference Guide** contains information for setup and management of the Switch. This manual is intended for network managers familiar with network management concepts and terminology.

## Typographical Conventions

Convention	Description
[ ]	In a command line, square brackets indicate an optional entry. For example: [copy filename] means that optionally you can type copy followed by the name of the file. Do not type the brackets.
<b>Bold font</b>	Indicates a button, a toolbar icon, menu, or menu item. For example: Open the <b>File</b> menu and choose <b>Cancel</b> . Used for emphasis. May also indicate system messages or prompts appearing on screen. For example: <b>You have mail</b> . <b>Bold</b> font is also used to represent filenames, program names and commands. For example: <b>use the copy command</b> .
<b>Boldface Typewriter Font</b>	Indicates commands and responses to prompts that must be typed exactly as printed in the manual.
Initial capital letter	Indicates a window name. Names of keys on the keyboard have initial capitals. For example: Click Enter.
<b>Menu Name &gt; Menu Option</b>	<b>Menu Name &gt; Menu Option</b> Indicates the menu structure. <b>Device &gt; Port &gt; Port Properties</b> means the Port Properties menu option under the Port menu option that is located under the Device menu.

## Notes, Notices and Cautions

A **NOTE** indicates important information that helps make better use of the device.

A **NOTICE** indicates either potential damage to hardware or loss of data and tells how to avoid the problem.

A **CAUTION** indicates a potential for property damage, personal injury, or death.

## Safety Instructions

Use the following safety guidelines to ensure your own personal safety and to help protect your system from potential damage. Throughout this safety section, the caution icon () is used to indicate cautions and precautions that need to be reviewed and followed.

## Safety Cautions

To reduce the risk of bodily injury, electrical shock, fire, and damage to the equipment observe the following precautions:

- Observe and follow service markings.
  - Do not service any product except as explained in the system documentation.
  - Opening or removing covers that are marked with the triangular symbol with a lightning bolt may expose the user to electrical shock.
  - Only a trained service technician should service components inside these compartments.
- If any of the following conditions occur, unplug the product from the electrical outlet and replace the part or contact your trained service provider:
  - Damage to the power cable, extension cable, or plug.
  - An object has fallen into the product.
  - The product has been exposed to water.
  - The product has been dropped or damaged.
  - The product does not operate correctly when the operating instructions are correctly followed.
- Keep your system away from radiators and heat sources. Also, do not block cooling vents.
- Do not spill food or liquids on system components, and never operate the product in a wet environment. If the system gets wet, see the appropriate section in the troubleshooting guide or contact your trained service provider.
- Do not push any objects into the openings of the system. Doing so can cause fire or electric shock by shorting out interior components.
- Use the product only with approved equipment.
- Allow the product to cool before removing covers or touching internal components.
- Operate the product only from the type of external power source indicated on the electrical ratings label. If unsure of the type of power source required, consult your service provider or local power company.
- To help avoid damaging the system, be sure the voltage selection switch (if provided) on the power supply is set to match the power available at the Switch's location:
  - 115 volts (V)/60 hertz (Hz) in most of North and South America and some Far Eastern countries such as South Korea and Taiwan
  - 100 V/50 Hz in eastern Japan and 100 V/60 Hz in western Japan
  - 230 V/50 Hz in most of Europe, the Middle East, and the Far East
- Also, be sure that attached devices are electrically rated to operate with the power available in your location.
- Use only approved power cable(s). If you have not been provided with a power cable for your system or for any AC-powered option intended for your system, purchase a power cable that is approved for use in your country. The power cable must be rated for the product and for the voltage and current marked on the product's electrical ratings label. The voltage and current rating of the cable should be greater than the ratings marked on the product.
- To help prevent electric shock, plug the system and peripheral power cables into properly grounded electrical outlets. These cables are equipped with three-prong plugs to help ensure proper grounding. Do not use adapter plugs or remove the grounding prong from a cable. If using an extension cable is necessary, use a 3-wire cable with properly grounded plugs.
- Observe extension cable and power strip ratings. Make sure that the total ampere rating of all products plugged into the extension cable or power strip does not exceed 80 percent of the ampere ratings limit for the extension cable or power strip.
- To help protect the system from sudden, transient increases and decreases in electrical power, use a surge suppressor, line conditioner, or uninterruptible power supply (UPS).

- Position system cables and power cables carefully; route cables so that they cannot be stepped on or tripped over. Be sure that nothing rests on any cables.
- Do not modify power cables or plugs. Consult a licensed electrician or your power company for site modifications. Always follow your local/national wiring rules.
- When connecting or disconnecting power to hot-pluggable power supplies, if offered with your system, observe the following guidelines:
  - Install the power supply before connecting the power cable to the power supply.
  - Unplug the power cable before removing the power supply.
  - If the system has multiple sources of power, disconnect power from the system by unplugging all power cables from the power supplies.
- Move products with care; ensure that all casters and/or stabilizers are firmly connected to the system. Avoid sudden stops and uneven surfaces.

## General Precautions for Rack-Mountable Products

Observe the following precautions for rack stability and safety. Also, refer to the rack installation documentation accompanying the system and the rack for specific caution statements and procedures.

- Systems are considered to be components in a rack. Thus, "component" refers to any system as well as to various peripherals or supporting hardware.

**CAUTION:** Installing systems in a rack without the front and side stabilizers installed could cause the rack to tip over, potentially resulting in bodily injury under certain circumstances. Therefore, always install the stabilizers before installing components in the rack. After installing system/components in a rack, never pull more than one component out of the rack on its slide assemblies at one time. The weight of more than one extended component could cause the rack to tip over and may result in serious injury.

- Before working on the rack, make sure that the stabilizers are secured to the rack, extended to the floor, and that the full weight of the rack rests on the floor. Install front and side stabilizers on a single rack or front stabilizers for joined multiple racks before working on the rack.
- Always load the rack from the bottom up, and load the heaviest item in the rack first.
- Make sure that the rack is level and stable before extending a component from the rack.
- Use caution when pressing the component rail release latches and sliding a component into or out of a rack; the slide rails can pinch your fingers.
- After a component is inserted into the rack, carefully extend the rail into a locking position, and then slide the component into the rack.
- Do not overload the AC supply branch circuit that provides power to the rack. The total rack load should not exceed 80 percent of the branch circuit rating.
- Ensure that proper airflow is provided to components in the rack.
- Do not step on or stand on any component when servicing other components in a rack.

**NOTE:** A qualified electrician must perform all connections to DC power and to safety grounds. All electrical wiring must comply with applicable local or national codes and practices.

**CAUTION:** Never defeat the ground conductor or operate the equipment in the absence of a suitably installed ground conductor. Contact the appropriate electrical inspection authority or an electrician if uncertain that suitable grounding is available.

**CAUTION:** The system chassis must be positively grounded to the rack cabinet frame. Do not attempt to connect power to the system until grounding cables are connected. Completed power and safety ground wiring must be inspected by a qualified electrical inspector. An energy hazard will exist if the safety ground cable is omitted or disconnected.

## Protecting Against Electrostatic Discharge

Static electricity can harm delicate components inside the system. To prevent static damage, discharge static electricity from your body before touching any of the electronic components, such as the microprocessor. This can be done by periodically touching an unpainted metal surface on the chassis.

The following steps can also be taken prevent damage from electrostatic discharge (ESD):

1. When unpacking a static-sensitive component from its shipping carton, do not remove the component from the antistatic packing material until ready to install the component in the system. Just before unwrapping the antistatic packaging, be sure to discharge static electricity from your body.
2. When transporting a sensitive component, first place it in an antistatic container or packaging.
3. Handle all sensitive components in a static-safe area. If possible, use antistatic floor pads, workbench pads and an antistatic grounding strap.

# Chapter 1    Web-based Switch Configuration

## ***Introduction***

### ***Login to the Web Manager***

### ***Web-based User Interface***

### ***Web Pages***

## Introduction

Most software functions of the **DGS-3420 Series** switches can be managed, configured and monitored via the embedded web-based (HTML) interface. Manage the Switch from remote stations anywhere on the network through a standard browser. The browser acts as a universal access tool and can communicate directly with the Switch using the HTTP protocol.

## Login to the Web Manager

To begin managing the Switch, simply run the browser installed on your computer and point it to the IP address you have defined for the device. The URL in the address bar should read something like: <http://123.123.123.123>, where the numbers 123 represent the IP address of the Switch.

**NOTE:** The factory default IP address, for a normal port, is 10.90.90.90. The factory default IP address, for the management port, is 192.168.0.1.

The Web User Interface's authentication window can be accessed using the IP address of 10.90.90.90 (normal port), as seen below.

**Figure 1-1 Enter Network Password window**

Leave both the **User Name** field and the **Password** field blank and click **OK**. This will open the Web-based user interface. The Switch management features available in the web-based manager are explained below.

## Web-based User Interface

The user interface provides access to various Switch configuration and management windows, allows you to view performance statistics, and permits you to graphically monitor the system status.

## Areas of the User Interface

The figure below shows the user interface. Three distinct areas divide the user interface, as described in the table.

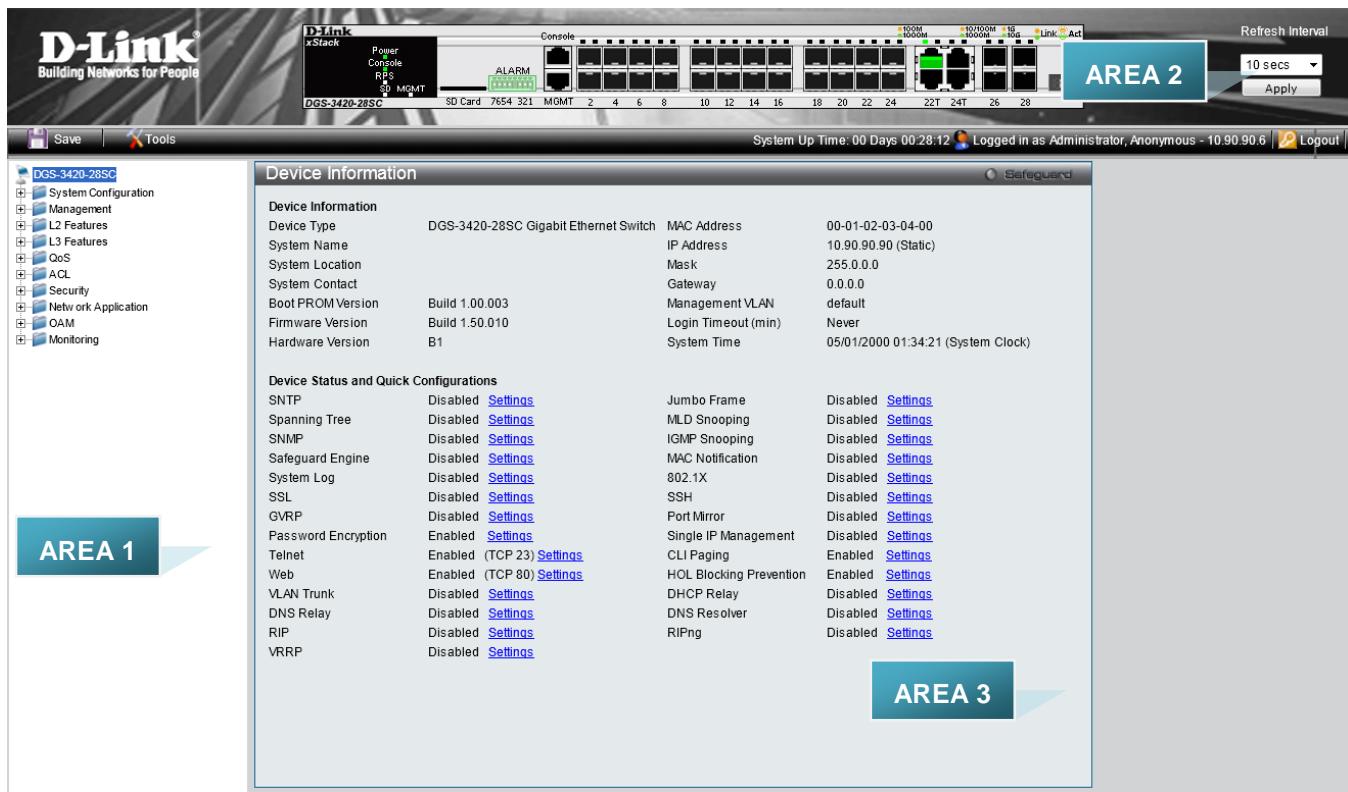

Figure 1-2 Main Web-Manager page

Area Number	Function
Area 1	Select the menu or window to display. Open folders and click the hyperlinked menu buttons and subfolders contained within them to display menus. Click the D-Link logo to go to the D-Link website.
Area 2	Presents a graphical near real-time image of the front panel of the Switch. This area displays the Switch's ports, console and management port, showing port activity. Some management functions, including save, reboot, download and upload are accessible here.
Area 3	Presents switch information based on user selection and the entry of configuration data.

**NOTE:** Any changes made to the Switch configuration during the current session must be saved in the Save Configuration / Log window or use the command line interface (CLI) command save.

## Web Pages

When connecting to the management mode of the Switch with a web browser, a login screen is displayed. Enter a user name and password to access the Switch's management mode.

Below is a list of the main folders available in the Web interface:

**System Configuration** - In this section the user will be able to configure features regarding the Switch's configuration.

**Management** - In this section the user will be able to configure features regarding the Switch's management.

**L2 Features** - In this section the user will be able to configure features regarding the Layer 2 functionality of the Switch.

**L3 Features** - In this section the user will be able to configure features regarding the Layer 3 functionality of the Switch.

**QoS** - In this section the user will be able to configure features regarding the Quality of Service functionality of the Switch.

**ACL** - In this section the user will be able to configure features regarding the Access Control List functionality of the Switch.

**Security** - In this section the user will be able to configure features regarding the Switch's security.

**Network Application** - In this section the user will be able to configure features regarding network applications handled by the Switch.

**OAM** - In this section the user will be able to configure features regarding the Switch's operations, administration and maintenance (OAM).

**Monitoring** - In this section the user will be able to monitor the Switch's configuration and statistics.

**NOTE:** Be sure to configure the user name and password in the User Accounts menu before connecting the Switch to the greater network.

## Device Information

This window contains the main settings for all the major functions for the Switch. It appears automatically when you log on to the Switch. To return to the Device Information window after viewing other windows, click the **DGS-3420-28SC** link.

The Device Information window shows the Switch's MAC Address (assigned by the factory and unchangeable), the Boot PROM Version, Firmware Version, Hardware Version, and many other important types of information. This is helpful to keep track of PROM and firmware updates and to obtain the Switch's MAC address for entry into another network device's address table, if necessary. In addition, this window displays the status of functions on the Switch to quickly assess their current global status.

Many functions are hyper-linked for easy access to enable quick configuration from this window.

Device Information			
Device Information			
Device Type	DGS-3420-28SC Gigabit Ethernet Switch	MAC Address	00-01-02-03-04-00
System Name		IP Address	10.90.90.90 (Static)
System Location		Mask	255.0.0.0
System Contact		Gateway	0.0.0.0

Figure 2-1 Device Information window

Click the [Settings](#) link to navigate to the appropriate feature page for configuration.

## System Information Settings

The user can enter a **System Name**, **System Location**, and **System Contact** to aid in defining the Switch.

To view the following window, click **System Configuration > System Information Settings**, as show below:

System Information Settings	
Unit ID	1
MAC Address	00-01-02-03-04-00
Firmware Version	Build 1.50.010
Hardware Version	B1
System Name	<input type="text"/>
System Location	<input type="text"/>
System Contact	<input type="text"/>
<input type="button" value="Apply"/>	

Figure 2-2 System Information Settings window

The fields that can be configured are described below:

Parameter	Description
<b>System Name</b>	Enter a system name for the Switch, if so desired. This name will identify it in the Switch network.

<b>System Location</b>	Enter the location of the Switch, if so desired.
<b>System Contact</b>	Enter a contact name for the Switch, if so desired.

Click the **Apply** button to implement changes made.

## Port Configuration

### DDM

This folder contains windows that perform Digital Diagnostic Monitoring (DDM) functions on the Switch. There are windows that allow the user to view the digital diagnostic monitoring status of SFP modules inserting to the Switch and to configure alarm settings, warning settings, temperature threshold settings, voltage threshold settings, bias current threshold settings, TX power threshold settings, and Rx power threshold settings.

### DDM Settings

The window is used to configure the action that will occur for specific ports when an exceeding alarm threshold or warning threshold event is encountered.

To view the following window, click **System Configuration > Port Configuration > DDM > DDM Settings**, as show below:

The screenshot shows the 'DDM Settings' window with the following configuration parameters:

- Trap State:** Enabled (radio button selected)
- Log State:** Enabled (radio button selected)
- Power Unit:** mW (radio button selected)
- Buttons:** Apply (top right), Apply (bottom right)

Below these parameters is a table with columns: Unit, From Port, To Port, State, Enabled, Shutdown. The values are set to 1, 1, 1, Enabled, Enabled, None respectively.

Unit	From Port	To Port	State	Enabled	Shutdown
1	1	1	Enabled	Enabled	None

The main part of the window is a table listing 20 ports (1:1 to 1:20) with their DDM State and Shutdown settings:

Port	DDM State	Shutdown
1:1	Enabled	None
1:2	Enabled	None
1:3	Enabled	None
1:4	Enabled	None
1:5	Enabled	None
1:6	Enabled	None
1:7	Enabled	None
1:8	Enabled	None
1:9	Enabled	None
1:10	Enabled	None
1:11	Enabled	None
1:12	Enabled	None
1:13	Enabled	None
1:14	Enabled	None
1:15	Enabled	None
1:16	Enabled	None
1:17	Enabled	None
1:18	Enabled	None
1:19	Enabled	None
1:20	Enabled	None

Figure 2-3 DDM Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Trap State</b>	Specify whether to send the trap, when the operating parameter exceeds the alarm or warning threshold.
<b>Log State</b>	Specify whether to send the log, when the operating parameter exceeds the alarm or warning threshold.
<b>Power Unit</b>	Select the power unit used here. Options to choose from are <i>mW</i> and <i>dBm</i> .
<b>Unit</b>	Select the unit to be configured.
<b>From Port / To Port</b>	Select a range of ports to be configured.
<b>State</b>	Use the drop-down menu to enable or disable the DDM state
<b>Shutdown</b>	Specifies whether to shutdown the port, when the operating parameter exceeds the <i>Alarm</i> or <i>Warning</i> threshold.

Click the **Apply** button to accept the changes made for each individual section.

## DDM Temperature Threshold Settings

This window is used to configure the DDM Temperature Threshold Settings for specific ports on the Switch.

To view the following window, click **System Configuration > Port Configuration > DDM > DDM Temperature Threshold Settings**, as show below:

**DDM Temperature Threshold Settings**

Unit	From Port	To Port	High Alarm (-128-127.996)	Low Alarm (-128-127.996)	High Warning (-128-127.996)	Low Warning (-128-127.996)
1	1	1	Celsius	Celsius	Celsius	Celsius

**Note:** (A) means that the threshold is administratively configured.

Port	High Alarm (Celsius)	Low Alarm (Celsius)	High Warning (Celsius)	Low Warning (Celsius)
1:1	-	-	-	-
1:2	-	-	-	-
1:3	-	-	-	-
1:4	-	-	-	-
1:5	-	-	-	-
1:6	-	-	-	-
1:7	-	-	-	-
1:8	-	-	-	-
1:9	-	-	-	-
1:10	-	-	-	-
1:11	-	-	-	-
1:12	-	-	-	-
1:13	-	-	-	-
1:14	-	-	-	-
1:15	-	-	-	-
1:16	-	-	-	-
1:17	-	-	-	-
1:18	-	-	-	-
1:19	-	-	-	-
1:20	-	-	-	-
1:21	-	-	-	-
1:22	-	-	-	-
1:23	-	-	-	-

**Figure 2-4 DDM Temperature Threshold Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit to be configured.
<b>From Port / To Port</b>	Select a range of ports to be configured.
<b>High Alarm (-128-127.996)</b>	This is the highest threshold for the alarm. When the operating parameter rises above this value, action associated with the alarm will be taken.
<b>Low Alarm (-128-127.996)</b>	This is the lowest threshold for the alarm. When the operating parameter falls below this value, action associated with the alarm will be taken.
<b>High Warning (-128-127.996)</b>	This is the highest threshold for the warning. When the operating parameter rises above this value, action associated with the warning will be taken.
<b>Low Warning (-128-127.996)</b>	This is the lowest threshold for the warning. When the operating parameter falls below this value, action associated with the warning will be taken.

Click the **Apply** button to accept the changes made.

## DDM Voltage Threshold Settings

This window is used to configure the DDM Voltage Threshold Settings for specific ports on the Switch.

To view the following window, click **System Configuration > Port Configuration > DDM > DDM Voltage Threshold Settings**, as show below:

**DDM Voltage Threshold Settings**

Unit	From Port	To Port	High Alarm (0-6.5535)	Low Alarm (0-6.5535)	High Warning (0-6.5535)	Low Warning (0-6.5535)
1	1	1	Volt	Volt	Volt	Volt

**DDM Voltage Threshold Settings**

Port	High Alarm (Volt)	Low Alarm (Volt)	High Warning (Volt)	Low Warning (Volt)
1:1	-	-	-	-
1:2	-	-	-	-
1:3	-	-	-	-
1:4	-	-	-	-
1:5	-	-	-	-
1:6	-	-	-	-
1:7	-	-	-	-
1:8	-	-	-	-
1:9	-	-	-	-
1:10	-	-	-	-
1:11	-	-	-	-
1:12	-	-	-	-
1:13	-	-	-	-
1:14	-	-	-	-
1:15	-	-	-	-
1:16	-	-	-	-
1:17	-	-	-	-

1:19	-	-	-	-
1:20	-	-	-	-
1:21	-	-	-	-
1:22	-	-	-	-
1:23	-	-	-	-

**Note:** (A) means that the threshold is administratively configured.

Figure 2-5 DDM Voltage Threshold Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit to be configured.
<b>From Port / To Port</b>	Select a range of ports to be configured.
<b>High Alarm (0-6.5535)</b>	This is the highest threshold for the alarm. When the operating parameter rises above this value, action associated with the alarm will be taken.
<b>Low Alarm (0-6.5535)</b>	This is the lowest threshold for the alarm. When the operating parameter falls below this value, action associated with the alarm will be taken.
<b>High Warning (0-6.5535)</b>	This is the highest threshold for the warning. When the operating parameter rises above this value, action associated with the warning will be taken.
<b>Low Warning (0-6.5535)</b>	This is the lowest threshold for the warning. When the operating parameter falls below this value, action associated with the warning will be taken.

Click the **Apply** button to accept the changes made.

## DDM Bias Current Threshold Settings

This window is used to configure the threshold of the bias current for specific ports on the Switch.

To view the following window, click **System Configuration > Port Configuration > DDM > DDM Bias Current Threshold Settings**, as show below:

**DDM Bias Current Threshold Settings**

Unit	From Port	To Port	High Alarm (0-131) mA	Low Alarm (0-131) mA	High Warning (0-131) mA	Low Warning (0-131) mA	Apply
1	1	1					
Port	High Alarm (mA)	Low Alarm (mA)	High Warning (mA)	Low Warning (mA)			
1:1	-	-	-	-			
1:2	-	-	-	-			
1:3	-	-	-	-			
1:4	-	-	-	-			
1:5	-	-	-	-			
1:6	-	-	-	-			
1:7	-	-	-	-

1:11	-	-	-	-			
1:12	-	-	-	-			
1:13	-	-	-	-			
1:14	-	-	-	-			
1:15	-	-	-	-			
1:16	-	-	-	-			
1:17	-	-	-	-			
1:18	-	-	-	-			
1:19	-	-	-	-			
1:20	-	-	-	-			
1:21	-	-	-	-			
1:22	-	-	-	-			
1:23	-	-	-	-			

**Note:** (A) means that the threshold is administratively configured.

Figure 2-6 DDM Bias Current Threshold Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit to be configured.
<b>From Port / To Port</b>	Select a range of ports to be configured.
<b>High Alarm (0-131)</b>	This is the highest threshold for the alarm. When the operating parameter rises above this value, action associated with the alarm will be taken.
<b>Low Alarm (0-131)</b>	This is the lowest threshold for the alarm. When the operating parameter falls below this value, action associated with the alarm will be taken.
<b>High Warning (0-131)</b>	This is the highest threshold for the warning. When the operating parameter rises above this value, action associated with the warning will be taken.
<b>Low Warning (0-131)</b>	This is the lowest threshold for the warning. When the operating parameter falls below this value, action associated with the warning will be taken.

Click the **Apply** button to accept the changes made.

## DDM TX Power Threshold Settings

This window is used to configure the threshold of TX power for specific ports on the Switch.

To view the following window, click **System Configuration > Port Configuration > DDM > DDM TX Power Threshold Settings**, as show below:

**DDM TX Power Threshold Settings**

Unit	From Port	To Port	High Alarm (0-6.5535)	Low Alarm (0-6.5535)	High Warning (0-6.5535)	Low Warning (0-6.5535)	Apply		
1	1	1		mW		mW		mW	Apply
Port	High Alarm (mW)		Low Alarm (mW)		High Warning (mW)		Low Warning (mW)		
1:1	-		-		-		-		
1:2	-		-		-		-		
1:3	-		-		-		-		
1:4	-		-		-		-		
1:5	-		-		-		-		
1:6	-		-		-		-		
1:7	-		-		-		-

1:11	-		-		-		-		
1:12	-		-		-		-		
1:13	-		-		-		-		
1:14	-		-		-		-		
1:15	-		-		-		-		
1:16	-		-		-		-		
1:17	-		-		-		-		
1:18	-		-		-		-		
1:19	-		-		-		-		
1:20	-		-		-		-		
1:21	-		-		-		-		
1:22	-		-		-		-		
1:23	-		-		-		-		

**Note:** (A) means that the threshold is administratively configured.

Figure 2-7 DDM TX Power Threshold Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit to be configured.
<b>From Port / To Port</b>	Select a range of ports to be configured.
<b>High Alarm (0-6.5535)</b>	This is the highest threshold for the alarm. When the operating parameter rises above this value, action associated with the alarm will be taken.
<b>Low Alarm (0-6.5535)</b>	This is the lowest threshold for the alarm. When the operating parameter falls below this value, action associated with the alarm will be taken.
<b>High Warning (0-6.5535)</b>	This is the highest threshold for the warning. When the operating parameter rises above this value, action associated with the warning will be taken.
<b>Low Warning (0-6.5535)</b>	This is the lowest threshold for the warning. When the operating parameter falls below this value, action associated with the warning will be taken.

Click the **Apply** button to accept the changes made.

## DDM RX Power Threshold Settings

This window is used to configure the threshold of RX power for specific ports on the Switch.

To view the following window, click **System Configuration > Port Configuration > DDM > DDM RX Power Threshold Settings**, as show below:

**DDM RX Power Threshold Settings**

Unit	From Port	To Port	High Alarm (0-6.5535)	Low Alarm (0-6.5535)	High Warning (0-6.5535)	Low Warning (0-6.5535)	Apply
1	1	1	<input type="text"/> mW	<input type="text"/> mW	<input type="text"/> mW	<input type="text"/> mW	<input type="button" value="Apply"/>

Port	High Alarm (mW)	Low Alarm (mW)	High Warning (mW)	Low Warning (mW)
1:1	-	-	-	-
1:2	-	-	-	-
1:3	-	-	-	-
1:4	-	-	-	-
1:5	-	-	-	-
1:6	-	-	-	-
1:7	-	-	-	-
1:8	-	-	-	-
1:9	-	-	-	-
1:10	-	-	-	-
1:11	-	-	-	-
1:12	-	-	-	-
1:13	-	-	-	-
1:14	-	-	-	-
1:15	-	-	-	-
1:16	-	-	-	-
1:17	-	-	-	-
1:18	-	-	-	-
1:19	-	-	-	-
1:20	-	-	-	-
1:21	-	-	-	-
1:22	-	-	-	-
1:23	-	-	-	-

**Note:** (A) means that the threshold is administratively configured.

Figure 2-8 DDM RX Power Threshold Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit to be configured.
<b>From Port / To Port</b>	Select a range of ports to be configured.
<b>High Alarm (0-6.5535)</b>	This is the highest threshold for the alarm. When the operating parameter rises above this value, action associated with the alarm will be taken.
<b>Low Alarm (0-6.5535)</b>	This is the lowest threshold for the alarm. When the operating parameter falls below this value, action associated with the alarm will be taken.
<b>High Warning (0-6.5535)</b>	This is the highest threshold for the warning. When the operating parameter rises above this value, action associated with the warning will be taken.
<b>Low Warning (0-6.5535)</b>	This is the lowest threshold for the warning. When the operating parameter falls below this value, action associated with the warning will be taken.

Click the **Apply** button to accept the changes made.

## DDM Status Table

This window is used to display the current operating digital diagnostic monitoring parameters and their values on the SFP module for specified ports.

To view the following window, click **System Configuration > Port Configuration > DDM > DDM Status Table**, as shown below:

DDM Status Table						Safeguard
Port	Temperature (Celsius)	Voltage (V)	Bias Current (mA)	TX Power (mW)	RX Power (mW)	
1:1	-	-	-	-	-	
1:2	-	-	-	-	-	
1:3	-	-	-	-	-	
1:4	-	-	-	-	-	
1:5	-	-	-	-	-	
1:6	-	-	-	-	-	
1:7	-	-	-	-	-	
1:8	-	-	-	-	-	
1:9	-	-	-	-	-	
1:10	-	-	-	-	-	
1:11	-	-	-	-	-	
1:12	-	-	-	-	-	
1:13	-	-	-	-	-	
1:14	-	-	-	-	-	
1:15	-	-	-	-	-	
1:16	-	-	-	-	-	
1:17	-	-	-	-	-	
1:18	-	-	-	-	-	
1:19	-	-	-	-	-	
1:20	-	-	-	-	-	
1:21	-	-	-	-	-	
1:22	-	-	-	-	-	
1:23	-	-	-	-	-	
1:24	-	-	-	-	-	
1:25	-	-	-	-	-	
1:26	-	-	-	-	-	

**Note:** (A) means that the threshold is administratively configured.

Figure 2-9 DDM Status Table window

## Port Settings

This page used to configure the details of the switch ports.

To view the following window, click **System Configuration > Port Configuration > Port Settings**, as show below:

The screenshot shows the 'Port Settings' window with the following configuration:

- Unit:** 1
- From Port:** 01
- To Port:** 01
- State:** Enabled
- Flow Control:** Disabled
- Address Learning:** Enabled
- MDIX:** Auto
- Medium Type:** Copper
- Speed/Duplex:** Auto
- Capability Advertised:** 10 Half, 10 Full, 100 Half, 100 Full, 1000 Full
- Auto Negotiation:** Enabled
- Restart An:** ANE

**Unit 1 Settings**

Port	State	Speed/Duplex	Flow Control	Connection	MDIX	Address Learning
01	Enabled	Auto	Disabled	Link Down	Auto	Enabled
02	Enabled	Auto	Disabled	Link Down	Auto	Enabled
03	Enabled	Auto	Disabled	Link Down	Auto	Enabled
04	Enabled	Auto	Disabled	Link Down	Auto	Enabled
05	Enabled	Auto	Disabled	Link Down	Auto	Enabled
06	Enabled	Auto	Disabled	Link Down	Auto	Enabled
07	Enabled	Auto	Disabled	Link Down	Auto	Enabled
08	Enabled	Auto	Disabled	Link Down	Auto	Enabled
09	Enabled	Auto	Disabled	Link Down	Auto	Enabled
10	Enabled	Auto	Disabled	Link Down	Auto	Enabled
11	Enabled	Auto	Disabled	Link Down	Auto	Enabled
12	Enabled	Auto	Disabled	Link Down	Auto	Enabled
13	Enabled	Auto	Disabled	Link Down	Auto	Enabled
14	Enabled	Auto	Disabled	Link Down	Auto	Enabled
15	Enabled	Auto	Disabled	Link Down	Auto	Enabled
16	Enabled	Auto	Disabled	Link Down	Auto	Enabled
17	Enabled	Auto	Disabled	Link Down	Auto	Enabled
18	Enabled	Auto	Disabled	Link Down	Auto	Enabled
19	Enabled	Auto	Disabled	Link Down	Auto	Enabled
20	Enabled	Auto	Disabled	Link Down	Auto	Enabled
21 (C)	Enabled	Auto	Disabled	1000M/Full/None	Auto	Enabled
21 (F)	Enabled	Auto	Disabled	Link Down	Auto	Enabled

**Note:** ANE means Auto Negotiation Error.

Figure 2-10 Port Settings window

### To configure switch ports:

1. Choose the port or sequential range of ports using the **From Port** and **To Port** drop-down menus.
2. Use the remaining drop-down menus to configure the parameters described below:

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the appropriate port range used for the configuration here.
<b>State</b>	Toggle the State field to either enable or disable a given port or group of ports.
<b>Speed/Duplex</b>	Use the drop-down menu to select the speed in <i>Auto</i> , <i>10M Half</i> , <i>10M Full</i> , <i>100M Half</i> , <i>100M Full</i> , <i>1000M Full_Master</i> and <i>1000M Full_Slave</i> . <i>Auto</i> denotes auto-negotiation among 10,

	<p>100 and 1000 Mbps devices, in full- or half-duplex (except 1000 Mbps which is always full duplex). The <i>Auto</i> setting allows the port to automatically determine the fastest settings the device the port is connected to can handle, and then to use those settings. The other options are <i>10M Half</i>, <i>10M Full</i>, <i>100M Half</i>, <i>100M Full</i>, <i>1000M Full_Master</i>, <i>1000M Full_Slave</i>, and <i>1000M Full</i>. There is no automatic adjustment of port settings with any option other than <i>Auto</i>.</p> <p>The Switch allows the user to configure two types of gigabit connections; <i>1000M Full_Master</i>, and <i>1000M Full_Slave</i> which refer to connections running a 1000BASE-T cable for connection between the Switch port and other device capable of a gigabit connection. The master setting (<i>1000M Full_Master</i>) will allow the port to advertise capabilities related to duplex, speed and physical layer type. The master setting will also determine the master and slave relationship between the two connected physical layers. This relationship is necessary for establishing the timing control between the two physical layers. The timing control is set on a master physical layer by a local source. The slave setting (<i>1000M Full_Slave</i>) uses loop timing, where the timing comes from a data stream received from the master. If one connection is set for <i>1000M Full_Master</i>, the other side of the connection must be set for <i>1000M Full_Slave</i>. Any other configuration will result in a link down status for both ports.</p>
<b>Capability Advertised</b>	When the <b>Speed/Duplex</b> is set to <i>Auto</i> , these capabilities are advertised during auto negotiation.
<b>Flow Control</b>	Displays the flow control scheme used for the various port configurations. Ports configured for full-duplex use 802.3x flow control, half-duplex ports use backpressure flow control, and Auto ports use an automatic selection of the two. The default is Disabled.
<b>Connection</b>	Here the current connection speed will be displayed.
<b>MDIX</b>	<p><i>Auto</i> - Select auto for auto sensing of the optimal type of cabling.</p> <p><i>Normal</i> - Select normal for normal cabling. If set to normal state, the port is in MDI mode and can be connected to a PC NIC using a straight-through cable or a port (in MDI mode) on another switch through a cross-over cable.</p> <p><i>Cross</i> - Select cross for cross cabling. If set to cross state, the port is in MDIX mode, and can be connected to a port (in MDI mode) on another switch through a straight cable.</p>
<b>Address Learning</b>	Enable or disable MAC address learning for the selected ports. When <i>Enabled</i> , destination and source MAC addresses are automatically listed in the forwarding table. When address learning is <i>Disabled</i> , MAC addresses must be manually entered into the forwarding table. This is sometimes done for reasons of security or efficiency. See the section on Forwarding/Filtering for information on entering MAC addresses into the forwarding table. The default setting is <i>Enabled</i> .
<b>Medium Type</b>	If configuring the Combo ports, this defines the type of transport medium to be used.
<b>Auto Negotiation</b>	<p>Use the drop-down menu to specify the auto-negotiation configuration.</p> <p><i>Restart An</i> – Select to restart the auto-negotiation process</p> <p><i>Remote Fault Advertisedt</i> - The remote fault advertisement option will be configured.</p>

Click the **Apply** button to implement changes made.

Click the **Refresh** button to refresh the display section of this page.

## Port Description Settings

The Switch supports a port description feature where the user may name various ports.

To view the following window, click **System Configuration > Port Configuration > Port Description Settings**, as show below:

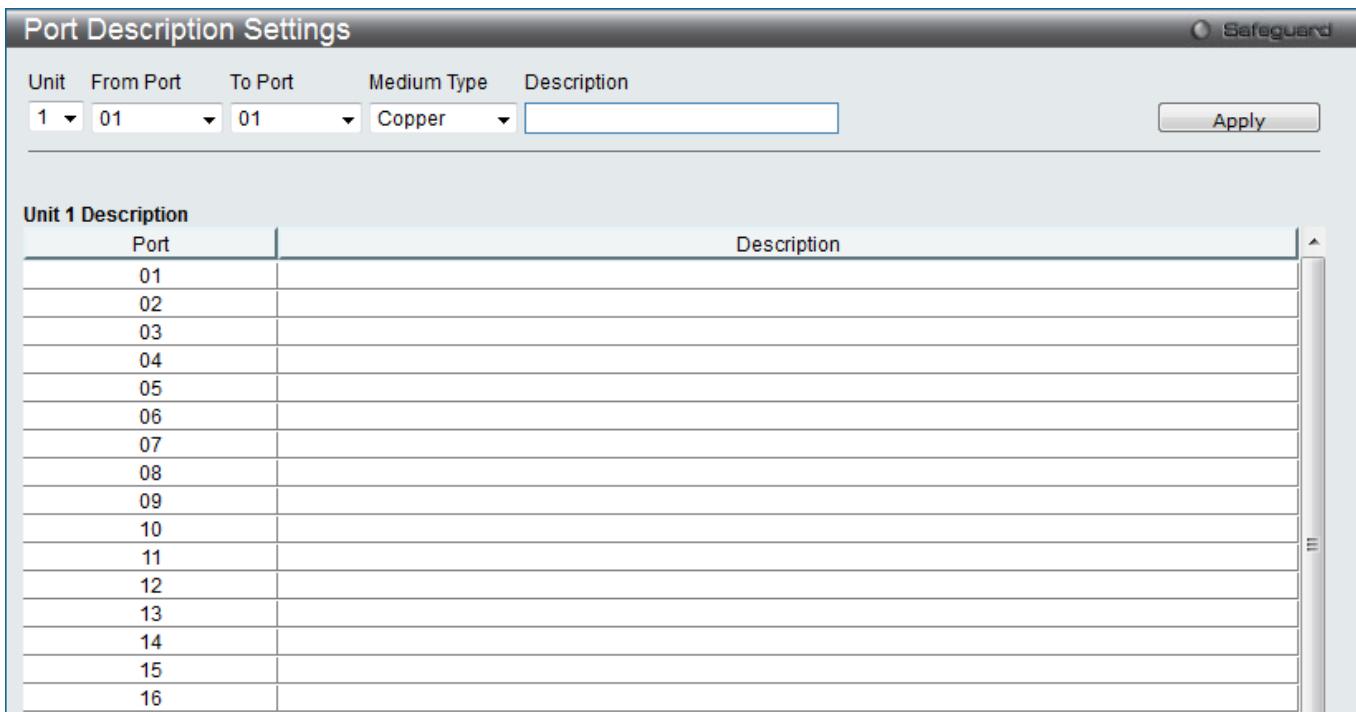

Figure 2-11 Port Description Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the appropriate port range used for the configuration here.
<b>Medium Type</b>	Specify the medium type for the selected ports. If configuring the Combo ports, the Medium Type defines the type of transport medium to be used, whether <i>Copper</i> or <i>Fiber</i> .
<b>Description</b>	Users may then enter a description for the chosen port(s).

Click the **Apply** button to implement changes made.

## Port Error Disabled

The following window displays the information about ports that have been disconnected by the Switch when a packet storm occurs or a loop was detected.

To view the following window, click **System Configuration > Port Configuration > Port Error Disabled**, as shown below:

Figure 2-12 Port Error Disabled

The fields that can be displayed are described below:

Parameter	Description
-----------	-------------

<b>Port</b>	Display the port that has been error disabled.
<b>Port State</b>	Describe the current running state of the port, whether enabled or disabled.
<b>Connection Status</b>	Display the uplink status of the individual ports, whether enabled or disabled.
<b>Reason</b>	Describe the reason why the port has been error-disabled, such as it has become a shutdown port for storm control.

## Port Media Type

The following window displays the information about the port media type.

To view the following window, click **System Configuration > Port Configuration > Port Media Type**, as shown below:

The screenshot shows a table titled "Unit 1 Information" with columns: Port, Type, Vendor Name / OUI, PN / Rev, SN / Date Code, and Compatibility. The "Port" column lists ports 1 through 24. The "Type" column for all ports is "1000Base-X". The "Vendor Name / OUI" and "PN / Rev" columns are empty. The "SN / Date Code" and "Compatibility" columns also appear empty. A dropdown menu labeled "Unit" is set to "1". A "Safeguard" button is visible in the top right corner.

Unit 1 Information					
Port	Type	Vendor Name / OUI	PN / Rev	SN / Date Code	Compatibility
1	1000Base-X				
2	1000Base-X				
3	1000Base-X				
4	1000Base-X				
5	1000Base-X				
6	1000Base-X				
7	1000Base-X				
8	1000Base-X				
9	1000Base-X				
10	1000Base-X				
11	1000Base-X				
12	1000Base-X				
13	1000Base-X				
14	1000Base-X				
15	1000Base-X				
16	1000Base-X				
17	1000Base-X				
18	1000Base-X				
19	1000Base-X				
20	1000Base-X				
21(C)	1000Base-T				
21(F)	1000Base-X				
22(C)	1000Base-T				
22(F)	1000Base-X				
23(C)	1000Base-T				

Figure 2-13 Port Media Type window

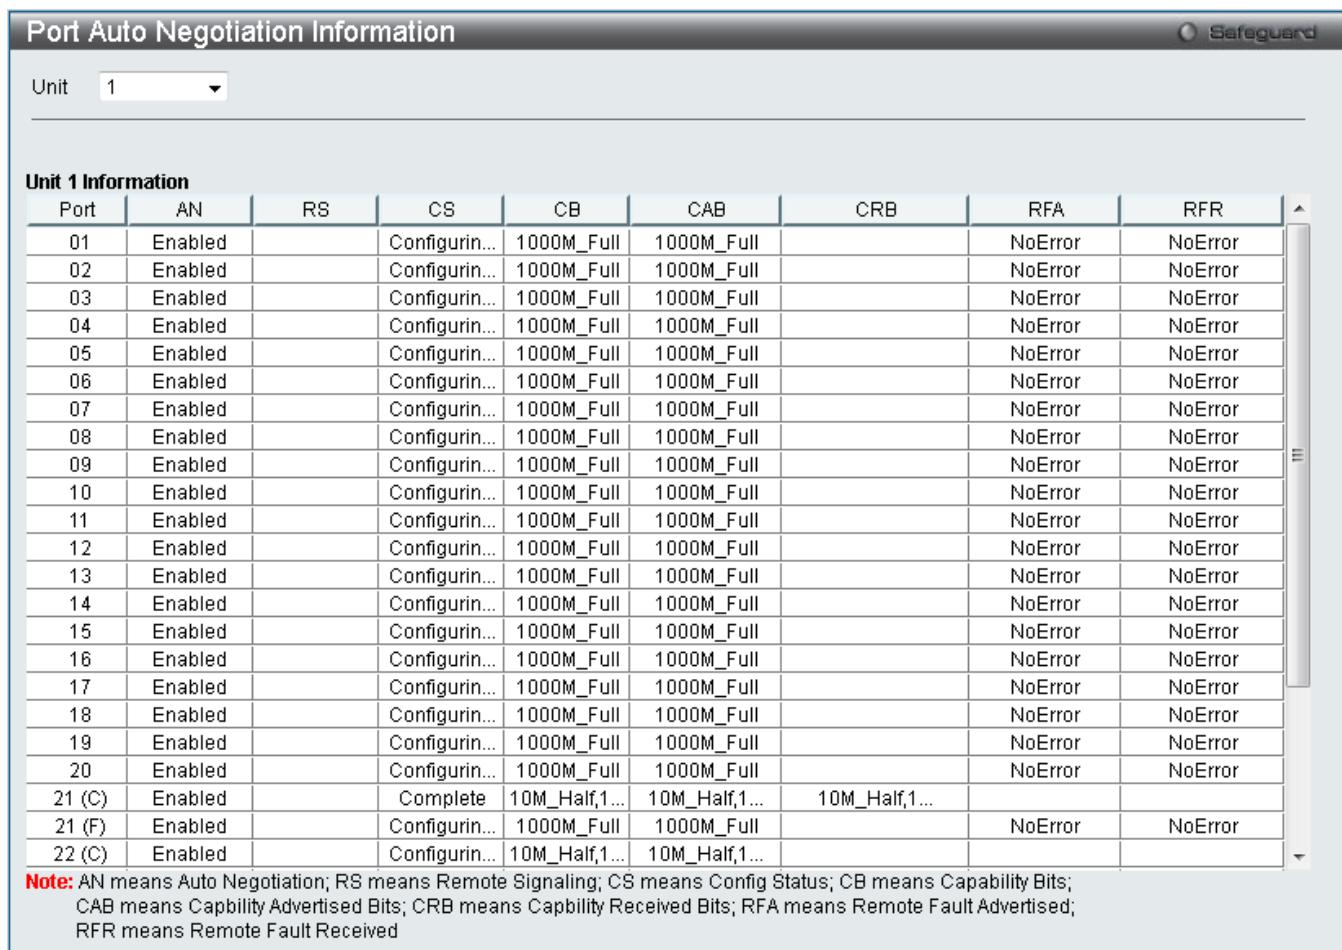

The fields that can be displayed are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Display the port number.
<b>Type</b>	Displays the port media type.

## Port Auto Negotiation Information

The following window displays the detailed auto negotiation information.

To view the following window, click **System Configuration > Port Configuration > Port Auto Negotiation Information**, as show below:

The screenshot shows a table titled "Port Auto Negotiation Information" for Unit 1. The table has columns for Port, AN, RS, CS, CB, CAB, CRB, RFA, and RFR. The data is as follows:

Port	AN	RS	CS	CB	CAB	CRB	RFA	RFR
01	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
02	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
03	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
04	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
05	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
06	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
07	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
08	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
09	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
10	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
11	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
12	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
13	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
14	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
15	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
16	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
17	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
18	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
19	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
20	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
21 (C)	Enabled		Complete	10M_Half,1...	10M_Half,1...	10M_Half,1...		
21 (F)	Enabled		Configuring...	1000M_Full	1000M_Full		NoError	NoError
22 (C)	Enabled		Configuring...	10M_Half,1...	10M_Half,1...			

**Note:** AN means Auto Negotiation; RS means Remote Signaling; CS means Config Status; CB means Capability Bits; CAB means Capability Advertised Bits; CRB means Capbility Received Bits; RFA means Remote Fault Advertised; RFR means Remote Fault Received

Figure 2-14 Port Auto Negotiation Information window

The fields that can be displayed are described below:

Parameter	Description
Unit	Select the unit you wish to configure.

## Jumbo Frame Settings

The Switch supports jumbo frames. Jumbo frames are Ethernet frames with more than 1,518 bytes of payload. The Switch supports jumbo frames with a maximum frame size of up to 13,312 bytes.

To view the following window, click **System Configuration > Port Configuration > Jumbo Frame Settings**, as show below:

The screenshot shows the 'Jumbo Frame Settings' window. At the top, there's a 'Safeguard' button. Below it, under 'Jumbo Frame Global Settings', there's a radio button for 'Enabled' (selected) and one for 'Disabled'. A 'Current Status' message says 'The maximum size of frame is 1536 bytes.' To the right is an 'Apply' button. Under 'Jumbo Frame Port Settings', there's a table with columns 'Unit', 'From Port', 'To Port', and 'State'. A dropdown menu shows '1' for Unit, '01' for From Port, '01' for To Port, and 'Enabled' for State. Another 'Apply' button is to the right. The main area shows 'Unit 1 Settings' with a table of 18 ports, all set to 'Enabled'.

Port	Jumbo Frame State
1	Enabled
2	Enabled
3	Enabled
4	Enabled
5	Enabled
6	Enabled
7	Enabled
8	Enabled
9	Enabled

17	Enabled
18	Enabled

Figure 2-15 Jumbo Frame Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Jumbo Frame</b>	Use the radio buttons to enable or disable the Jumbo Frame function on the Switch. The default is Disabled. When disabled, the maximum frame size is 1536 bytes. When enabled, the maximum frame size is 13312 bytes.
<b>From Port / To Port</b>	Select the appropriate port range used for the configuration here.
<b>State</b>	Use the drop-down menu to enable the Jumbo Frame for the port.

Click the **Apply** button to implement changes made.

## EEE Settings

Energy Efficient Ethernet (EEE) is defined in IEEE 802.3az. It is designed to reduce the energy consumption of a link when no packets are being sent.

**NOTE:** This feature is only available on hardware version B1 and later.

To view the following window, click **System Configuration > Port Configuration > EEE Settings**, as show below:

The screenshot shows the EEE Settings window. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), 'To Port' (set to 01), and 'State' (set to Disabled). A 'Safeguard' button is in the top right. Below this is a table titled 'Unit 1 Settings' with 26 rows, each representing a port from 1 to 26. The 'State' column for all ports is set to 'Disabled'. The last two entries (ports 25 and 26) have 'N/A' listed under 'State'.

Port	State
1	Disabled
2	Disabled
3	Disabled

21	Disabled
22	Disabled
23	Disabled
24	Disabled
25	N/A
26	N/A

Figure 2-16 EEE Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the appropriate port range used for the configuration here.
<b>State</b>	Select to enable or disable the state of this feature here.

Click the **Apply** button to implement changes made.

## PoE

The DGS-3420-28PC and DGS-3420-52P switches support Power over Ethernet (PoE) as defined by the IEEE 802.3af and 802.3at. All ports can support PoE up to 30W. All the ports can supply about 48 VDC power to Powered Devices (PDs) over Category 5 or Category 3 UTP Ethernet cables. The Switch follows the standard PSE (Power Sourcing Equipment) pinout *Alternative A*, whereby power is sent out over pins 1, 2, 3 and 6. The Switches work with all D-Link 802.3af capable devices.

The Switch includes the following PoE features:

- Auto-discovery recognizes the connection of a PD (Powered Device) and automatically sends power to it.

- The Auto-disable feature occurs under two conditions: firstly, if the total power consumption exceeds the system power limit; and secondly, if the per port power consumption exceeds the per port power limit.
- Active circuit protection automatically disables the port if there is a short. Other ports will remain active.

<b>Based on 802.3af/at PDs receive power according to the following classification:</b>		<b>PSE provides power according to the following classification:</b>	
<b>Class</b>	<b>Maximum power available to PD</b>	<b>Class</b>	<b>Max. power used by PSE</b>
0	12.95W	0	15.4W
1	3.84W	1	4W
2	6.49W	2	7W
3	12.95W	3	15.4W
4	29.5W	User Define	35W

To configure the PoE features on the Switch, click **System Configuration > PoE**. The **PoE System Settings** window is used to assign a power limit and power disconnect method for the whole PoE system. To configure the **Power Limit** for the PoE system, enter a value between 37W and 760W for the Switch in the Power Limit field. When the total consumed power exceeds the power limit, the PoE controller (located in the PSE) disconnects the power to prevent overloading the power supply.

## PoE System Settings

To view the following window, click **System Configuration > PoE > PoE System Settings**, as show below:

Figure 2-17 PoE System Settings window

The following parameters can be configured:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure. Tick the <b>All</b> check box to select all units.
<b>Power Limit (37-760)</b>	Sets the limit of power to be used from the Switch's power source to PoE ports. The user may configure a Power Limit between 37W and 760W for the DGS-3420-28PC and DGS-3420-52P.
<b>Power Disconnect Method</b>	The PoE controller uses either <i>Deny Next Port</i> or <i>Deny Low Priority Port</i> to offset the power limit being exceeded and keeps the Switch's power at a usable level. Use the drop down menu to select a <b>Power Disconnect Method</b> . The default Power Disconnect Method is <i>Deny Next Port</i> . Both Power Disconnection Methods are described below:  <i>Deny Next Port</i> – After the power limit has been exceeded, the next port attempting to power up is denied, regardless of its priority. If Power Disconnection Method is set to <i>Deny Next Port</i> , the system cannot utilize out of its maximum power capacity. The maximum unused watt is 19W.  <i>Deny Low Priority Port</i> – After the power limit has been exceeded, the next port attempting to power up causes the port with the lowest priority to shut down so as to allow the high-priority and critical priority ports to power up.
<b>Legacy PD</b>	Use the drop-down menu to enable or disable detecting legacy PDs signal.

Click **Apply** to implement changes made.

**NOTE:** The Power Limit for this Switch without a Redundant Power Supply (RPS) is 390W. When the user adds an RPS, like the DPS-700, for the DGS-3420-28PC and the DGS-3420-52P, the Power Limit must be set to 760W.

## PoE Port Settings

To view the following window, click **System Configuration > PoE > PoE Port Settings**, as show below:

The screenshot shows the 'PoE Port Settings' window. At the top, there are dropdown menus for 'Unit' (1), 'From Port' (01), 'To Port' (01), 'State' (Enabled), 'Time Range' (disabled), 'Priority' (Low), and 'Power Limit' (Class 2). Below these are 'Apply' and 'Refresh' buttons. The main area is titled 'Unit 1 PoE Port Information' and contains a table with columns: Port, State, Time Range, Priority, Power Limit (mW), Class, Power (mW), Voltage (Decivolt), Current (mA), and Status.

Unit 1 PoE Port Information									
Port	State	Time Range	Priority	Power Limit (mW)	Class	Power (mW)	Voltage (Decivolt)	Current (mA)	Status

Figure 2-18 PoE Port Settings window

The following parameters can be configured:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select a range of ports from the drop-down menus to be enabled or disabled for PoE.
<b>State</b>	Use the drop-down menu to enable or disable ports for PoE.
<b>Time Range</b>	Select a range of the time to the port set as POE. If Time Range is configured, the power can only be supplied during the specified period of time.
<b>Priority</b>	Use the drop-down menu to select the priority of the PoE ports. Port priority determines the priority which the system attempts to supply the power to the ports. There are three levels of priority that can be selected, <i>Critical</i> , <i>High</i> , and <i>Low</i> . When multiple ports happen to have the same level of priority, the port ID will be used to determine the priority. The lower port ID has higher priority. The setting of priority will affect the order of supplying power. Whether the disconnect method is set to deny low priority port, the priority of each port will be used by the system to manage the supply of power to ports.
<b>Power Limit</b>	This function is used to configure the per-port power limit. If a port exceeds its power limit, it will shut down. Based on 802.3af/802.3at, there are different PD classes and power consumption ranges; Class 0 – 0.44~12.95W Class 1 – 0.44~3.84W Class 2 – 3.84~6.49W Class 3 – 6.49~12.95W Class 4 – 29.5W The following is the power limit applied to the port for these five classes. For each class, the power limit is a little more than the power consumption range for that class. This takes into account any power loss on the cable. Thus, the following are the typical values; Class 0 – 15400mW Class 1 – 4000mW Class 2 – 7000mW Class 3 – 15400mW <i>User Define</i> – 35000mW

Click **Apply** to implement changes made. The port status of all PoE configured ports is displayed in the table in the bottom half of the screen shown above.

## Serial Port Settings

This window allows the user to adjust the Baud Rate and the Auto Logout values.

To view the following window, click **System Configuration > Serial Port Settings**, as show below:

The window title is "Serial Port Settings". It contains the following fields:

- Baud Rate: 115200
- Auto Logout: 10 minutes
- Data Bits: 8
- Parity Bits: None
- Stop Bits: 1

An "Apply" button is located at the bottom right.

Figure 2-19 Serial Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Baud Rate</b>	Specify the baud rate for the serial port on the Switch. There are four possible baud rates to choose from, 9600, 19200, 38400 and 115200. For a connection to the Switch using the console port, the baud rate must be set to 115200, which is the default setting.
<b>Auto Logout</b>	Select the logout time used for the console interface. This automatically logs the user out after an idle period of time, as defined. Choose from the following options: 2, 5, 10, 15 minutes or Never. The default setting is 10 minutes.
<b>Data Bits</b>	Display the data bits used for the serial port connection.
<b>Parity Bits</b>	Display the parity bits used for the serial port connection.
<b>Stop Bits</b>	Display the stop bits used for the serial port connection.

Click the **Apply** button to implement changes made.

## Warning Temperature Settings

This window allows the user to configure the system warning temperature parameters.

To view the following window, click **System Configuration > Warning Temperature Settings**, as show below:

The window title is "Warning Temperature Settings". It contains the following fields:

- Set Warning Temperature
- Traps State: Disabled
- Log State: Disabled
- High Threshold (-500~500): [Input Field] celsius
- Low Threshold (-500~500): [Input Field] celsius

An "Apply" button is located at the bottom right.

Figure 2-20 Warning Temperature Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Traps State</b>	Use the drop-down menu to enable or disable the traps state option of the warning temperature setting.
<b>Log State</b>	Use the drop-down menu to enable or disable the log state option of the warning temperature setting.
<b>High Threshold (-500-500)</b>	Enter the high threshold value of the warning temperature setting.
<b>Low Threshold (-500-500)</b>	Enter the low threshold value of the warning temperature setting.

Click the **Apply** button to implement changes made.

## System Log configuration

### System Log Settings

The Switch allows users to choose a method for which to save the switch log to the flash memory of the Switch.

To view the following window, click **System Configuration > System Log Configuration > System Log Settings**, as show below:

Figure 2-21 System Log Settings window

The fields that can be configured are described below:

Parameter	Description
<b>System Log</b>	Use the radio buttons to enable or disable the system log settings. Click the <b>Apply</b> button to accept the changes made.
<b>Save Mode</b>	Use the drop-down menu to choose the method for saving the switch log to the flash memory. The user has three options: <i>On Demand</i> – Users who choose this method will only save log files when they manually tell the Switch to do so, either using the Save Log link in the Save folder. <i>Time Interval</i> – Users who choose this method can configure a time interval by which the Switch will save the log files, in the box adjacent to this configuration field. The user may set a time between 1 and 65535 minutes. <i>Log Trigger</i> – Users who choose this method will have log files saved to the Switch every time a log event occurs on the Switch.

Click the **Apply** button to implement changes made.

## System Log Server Settings

The Switch can send System log messages to up to four designated servers using the System Log Server. To view the following window, click **System Configuration > System Log Configuration > System Log Server Settings**, as show below:

System Log Server List					
Server ID	Server IP Address	Severity	Facility	UDP Port	Status
1		Emergency (0)	Local 0	514	Enabled

**Figure 2-22 System Log Server Settings**

The fields that can be configured are described below:

Parameter	Description
<b>Server ID</b>	System log server settings index (1 to 4).
<b>Severity</b>	Use the drop-down menu to select the higher level of messages that will be sent. All messages which level is higher than selecting level will be sent. The options are <i>Emergency(0)</i> , <i>Alert(1)</i> , <i>Critical(2)</i> , <i>Error(3)</i> , <i>Warning(4)</i> , <i>Notice(5)</i> , <i>Informational(6)</i> and <i>Debug(7)</i> .
<b>Server IPv4 Address</b>	The IPv4 address of the System log server.
<b>Server IPv6 Address</b>	The IPv6 address of the System log server.
<b>Facility</b>	Use the drop-down menu to select <i>Local 0</i> , <i>Local 1</i> , <i>Local 2</i> , <i>Local 3</i> , <i>Local 4</i> , <i>Local 5</i> , <i>Local 6</i> , or <i>Local 7</i> .
<b>UDP Port (514 or 6000-65535)</b>	Type the UDP port number used for sending System log messages. The default is 514.
<b>Status</b>	Choose <i>Enabled</i> or <i>Disabled</i> to activate or deactivate.

Click the **Apply** button to accept the changes made.

Click the **Delete All** button to remove all servers configured.

## System Log

Users can view and delete the local history log as compiled by the Switch's management agent.

To view the following window, click **System Configuration > System Log Configuration > System Log**, as show below:

The screenshot shows the 'System Log' window with the following interface elements:

- Log Type:** A dropdown menu currently set to 'Severity'. Other options include Emergency, Alert, Critical, Error, Warning, Notice, Informational, Debug, and All.
- Module List:** An input field containing '( Log Software Module: MSTP, DHCPv6\_CLIENT,...)'.
- Buttons:** Find, Clear Log, and Clear Attack Log.
- Total Entries: 14**
- Table:** Displays log entries with columns: Index, Time, Level, and Log Text. The entries are:

Index	Time	Level	Log Text
14	2000-01-19 19:17:11	INFO(6)	Successful login through Web (Username: Anonymous, IP: 192.168.69.66)
13	2000-01-19 19:17:03	INFO(6)	Logout through Web (Username: Anonymous, IP: 192.168.69.66)
12	2000-01-19 19:15:32	INFO(6)	Successful login through Web (Username: Anonymous, IP: 192.168.69.66)
11	2000-01-19 19:14:25	INFO(6)	Configuration saved to flash by console (Username: Anonymous)
10	2000-01-19 19:14:23	INFO(6)	Management IP address was changed by console (Username: Anonymous)

- Pagination:** 1/3, 1, 2, 3, >, >>, Go.

Figure 2-23 System Log window

The Switch can record event information in its own log. Click **Go** to go to the next page of the **System Log** window.

The fields that can be configured or displayed are described below:

Parameter	Description
<b>Log Type</b>	In the drop-down menu the user can select the log type that will be displayed. <b>Severity</b> - When selecting <b>Severity</b> from the drop-down menu, a secondary tick must be made. Secondary ticks are <b>Emergency</b> , <b>Alert</b> , <b>Critical</b> , <b>Error</b> , <b>Warning</b> , <b>Notice</b> , <b>Informational</b> and <b>Debug</b> . To view all information in the log, simply tick the <b>All</b> check box. Enter the module name to search for the specific module. <b>Module List</b> - When selecting <b>Module List</b> , the module name must be manually entered. Available modules are MSTP, DHCPv6_CLIENT, DHCPv6_RELAY, ERPS, ERROR_LOG, CFM_EXT, and DHCPv6_SERVER. <b>Attack Log</b> - When selecting <b>Attack Log</b> all attacks will be listed. Select a unit from the drop-down menu to display the result of the unit.
<b>Index</b>	A counter incremented whenever an entry to the Switch's history log is made. The table displays the last entry (highest sequence number) first.
<b>Time</b>	Display the time in days, hours, minutes, and seconds since the Switch was last restarted.
<b>Level</b>	Display the level of the log entry.
<b>Log Text</b>	Display text describing the event that triggered the history log entry.

Click the **Find** button to display the log in the display section according to the selection made.

Click the **Clear Log** button to clear the entries from the log in the display section.

Click the **Clear Attack Log** button to clear the entries from the attack log in the display section.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## System Log & Trap Settings

The Switch allows users to configure the system log source IP interface addresses here.

To view the following window, click **System Configuration > System Log Configuration > System Log & Trap Settings**, as show below:

The window contains two main sections:

- System Log Source IP Interface Settings:**
  - Interface Name: [Input Field]
  - IPv4 Address: [Input Field]
  - IPv6 Address: [Input Field]
- Trap Source IP Interface Settings:**
  - Interface Name: [Input Field]
  - IPv4 Address: [Input Field]
  - IPv6 Address: [Input Field]

Buttons at the bottom right: **Apply** and **Clear**.

Figure 2-24 System Log &amp; Trap Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Enter the IP interface name used.
<b>IPv4 Address</b>	Enter the IPv4 address used.
<b>IPv6 Address</b>	Enter the IPv6 address used.

Click the **Apply** button to accept the changes made.

Click the **Clear** button to clear all the information entered in the fields.

## System Severity Settings

The Switch can be configured to allow alerts be logged or sent as a trap to an SNMP agent. The level at which the alert triggers either a log entry or a trap message can be set as well. Use the System Severity Settings window to set the criteria for alerts. The current settings are displayed below the System Severity Table.

To view the following window, click **System Configuration > System Log Configuration > System Severity Settings**, as show below:

System Severity Table	
System Severity	Severity Level
Trap	Information (6)
Log	Information (6)

Figure 2-25 System Severity Settings window

The fields that can be configured are described below:

Parameter	Description
<b>System Severity</b>	Choose how the alerts are used from the drop-down menu. Select <i>Log</i> to send the alert of

	the Severity Type configured to the Switch's log for analysis. Choose <i>Trap</i> to send it to an SNMP agent for analysis, or select <i>All</i> to send the chosen alert type to an SNMP agent and the Switch's log for analysis.
<b>Severity Level</b>	This drop-down menu allows you to select the level of messages that will be sent. The options are <i>Emergency</i> (0), <i>Alert</i> (1), <i>Critical</i> (2), <i>Error</i> (3), <i>Warning</i> (4), <i>Notice</i> (5), <i>Information</i> (6) and <i>Debug</i> (7).

Click the **Apply** button to accept the changes made.

## Time Range Settings

Time range is a time period that the respective function will take an effect on, such as ACL. For example, the administrator can configure the time-based ACL to allow users to surf the Internet on every Saturday and every Sunday, meanwhile to deny users to surf the Internet on weekdays.

The user may enter up to 64 time range entries on the Switch.

To view the following window, click **System Configuration > Time Range Settings**, as show below:

The screenshot shows the 'Time Range Settings' configuration window. At the top, there are fields for 'Range Name' (with a note '(Max: 32 Characters)'), 'Hours (HH MM SS)' (with dropdown menus for Start Time and End Time), and 'Weekdays' (checkboxes for Mon-Sun and a 'Select All Days' option). Below these are buttons for 'Apply' and 'Cancel'. A summary table at the bottom displays 'Total Entries: 0' and columns for 'Range Name', 'Days', 'Start Time', and 'End Time'.

Figure 2-26 Time Range Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Range Name</b>	Enter a name of no more than 32 alphanumeric characters that will be used to identify this time range on the Switch. This range name will be used in the Access Profile table to identify the access profile and associated rule to be enabled during this time range.
<b>Hours (HH MM SS)</b>	This parameter is used to set the time in the day that this time range is to be enabled using the following parameters: <i>Start Time</i> - Use this parameter to identify the starting time of the time range, in hours, minutes and seconds, based on the 24-hour time system. <i>End Time</i> - Use this parameter to identify the ending time of the time range, in hours, minutes and seconds, based on the 24-hour time system.
<b>Weekdays</b>	Use the check boxes to select the corresponding days of the week that this time range is to be enabled. Tick the <i>Select All Days</i> check box to configure this time range for every day of the week.

Click the **Apply** button to accept the changes made. Current configured entries will be displayed in the **Time Range Information** table in the bottom half of the window shown above.

## Port Group Settings

This window is used to create port groups, and add or delete ports from the port groups.

To view the following window, click **System Configuration > Port Group Settings**, as show below:

The Port Group Settings window displays a summary of port group entries. It includes fields for Group Name, Port List, Group ID, Action, and Apply. Below this, a table lists the total entries, their Port Group ID, Port Group Name, and Ports, with a Delete button for each entry.

Total Entries: 1			
Port Group ID	Port Group Name	Ports	
1	Group		<b>Delete</b>

Figure 2-27 Port Group Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Group Name</b>	Enter the name of a port group.
<b>Group ID (1-64)</b>	Enter the ID of a port group
<b>Port List</b>	Enter a port or list of ports. Tick the All check box to apply to all ports.
<b>Action</b>	Use the drop-down menu to select <i>Create Port Group</i> , <i>Add Ports</i> or <i>Delete Ports</i> .

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry.

## Time Settings

Users can configure the time settings for the Switch.

To view the following window, click **System Configuration > Time Settings**, as show below:

The Time Settings window allows users to set the current date and time. It includes fields for Date (DD/MM/YYYY) and Time (HH:MM:SS), and an Apply button.

Set Current Time	
Date (DD / MM / YYYY)	30/10/2012
Time (HH: MM: SS)	10:42:30
<b>Apply</b>	

Figure 2-28 Time Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Date (DD/MM/YYYY)</b>	Enter the current day, month, and year to update the system clock.
<b>Time (HH:MM:SS)</b>	Enter the current time in hours, minutes, and seconds.

Click the **Apply** button to accept the changes made.

## User Accounts Settings

The Switch allows the control of user privileges.

To view the following window, click **System Configuration > User Accounts Settings**, as show below:

The screenshot shows the 'User Accounts Settings' window. At the top, there's a section for 'Add User Accounts' with fields for 'User Name' (text input), 'Access Right' (dropdown: Admin), 'Encryption' (dropdown: Plain Text), 'Password' (text input), 'Confirm Password' (text input), and an 'Apply' button. Below this is a note: 'Note: User Name should be less than 16 characters. Password should be less than 16 characters or 35 characters.' A table titled 'Total Entries: 3' lists three users: admin (Admin, Plain Text), operator (Admin, Plain Text), and poweruser (Admin, Plain Text). Each row has 'Edit' and 'Delete' buttons.

Figure 2-29 User Accounts Settings window

To add a new user, type in a User Name and New Password and retype the same password in the Confirm New Password field. Choose the level of privilege (Admin, Operator, Power User or User) from the Access Right drop-down menu.

Management	Admin	Operator	Power User	User
Configuration	ReadWrite	Read/Write–partly	Read/Write–partly	No
Network Monitoring	ReadWrite	ReadWrite	Read-only	Read-only
Community Strings and Trap Stations	ReadWrite	Read-only	Read-only	Read-only
Update Firmware and Configuration Files	ReadWrite	No	No	No
System Utilities	ReadWrite	Read-only	Read-only	Read-only
Factory Reset	ReadWrite	No	No	No
User Account Management				
Add/Update/Delete User Accounts	ReadWrite	No	No	No
View User Accounts	ReadWrite	No	No	No

The fields that can be configured are described below:

Parameter	Description
<b>User Name</b>	Enter a new user name for the Switch.
<b>Access Right</b>	Specify the access right for this user.
<b>Encryption</b>	Specifies that encryption will be applied to this account. Option to choose from are <i>Plain Text</i> , and <i>SHA-1</i> .
<b>Password</b>	Enter a new password for the Switch.
<b>Confirm Password</b>	Re-type in a new password for the Switch.

Click the **Apply** button to accept the changes made.

**NOTICE:** In case of lost passwords or password corruption, refer to Appendix A - Password Recovery Procedure which will guide you through the steps necessary to resolve this issue.

**NOTE:** User Name should be less than 16 characters. Password should be less than 16 or 35 characters.

## Command Logging Settings

This window is used to enable or disable the command logging settings.

To view this window, click **System Configuration > Command Logging Settings**, as shown below:

Command Logging Settings		Safeguard
Parameter	Description	
<b>Command Logging State</b>	Use the radio buttons to enable or disable the function.	
<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled		
<input type="button" value="Apply"/>		

Figure 2-30 Command Logging Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Command Logging State</b>	Use the radio buttons to enable or disable the function.

Click the **Apply** button to accept the changes made.

**NOTE:** When the switch is under the booting or executing downloaded configuration procedure, all configuration commands will not be logged. When the user uses AAA authentication to log in, the user name should not be changed if the user has used the Enable Admin function to replace its privilege.

## Stacking

From firmware release v1.00 of this Switch, the Switch now supports switch stacking, where a set of 12 switches can be combined to be managed by one IP address through Telnet, the GUI interface (web), the console port or through SNMP. Each switch of this series has two stacking ports which can be used to connect to other devices and make them stack together.

**Duplex Chain** – As shown in Figure 2-31, The Duplex Chain topology stacks switches together in a chain-link format. Using this method, data transfer is only possible in one direction and if there is a break in the chain, then data transfer will obviously be affected.

**Duplex Ring** – As shown in Figure 2-32, the Duplex Ring stacks switches in a ring or circle format where data can be transferred in two directions. This topology is very resilient due to the fact that if there is a break in the ring, data can still be transferred through the stacking cables between switches in the stack.

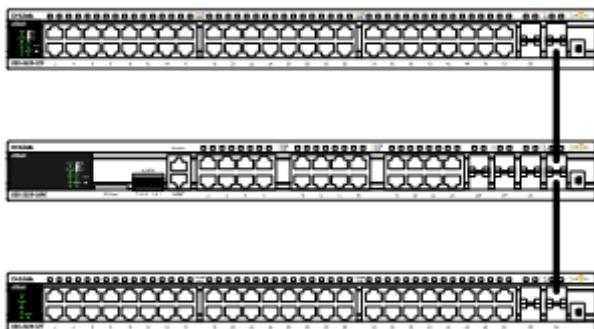

Figure 2-31 Switches stacked in a Duplex Chain

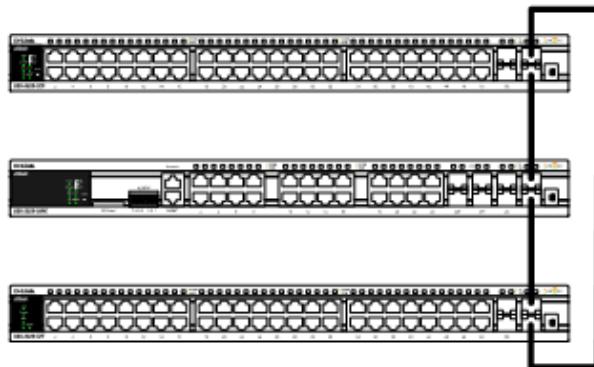

Figure 2-32 Switches stacked in a Duplex Ring

Within each of these topologies, each switch plays a role in the Switch stack. These roles can be set by the user per individual Switch, or if desired, can be automatically determined by the Switch stack. Three possible roles exist when stacking with the Switch.

**Primary Master** – The Primary Master is the leader of the stack. It will maintain normal operations, monitor operations and the running topology of the Stack. This switch will also assign Stack Unit IDs, synchronize configurations and transmit commands to remaining switches in the switch stack. The Primary Master can be manually set by assigning this Switch the highest priority (a lower number denotes a higher priority) before physically assembling the stack, or it can be determined automatically by the stack through an election process which determines the lowest MAC address and then will assign that switch as the Primary Master, if all priorities are the same. The Primary master are physically displayed by the seven segment LED to the far right on the front panel of the switch where this LED will flash between its given Box ID and 'H'.

**Backup Master** – The Backup Master is the backup to the Primary Master, and will take over the functions of the Primary Master if the Primary Master fails or is removed from the Stack. It also monitors the status of neighboring switches in the stack, will perform commands assigned to it by the Primary Master and will monitor the running status of the Primary Master. The Backup Master can be set by the user by assigning this Switch the second highest priority before physically assembling the stack, or it can be determined automatically by the stack through an election process which determines the second lowest MAC address and then will assign that switch as the Backup Master, if all priorities are the same. The Backup master are physically displayed by the seven segment LED to the far right on the front panel of the switch where this LED will flash between its given Box ID and 'h'.

**Slave** – Slave switches constitute the rest of the switch stack and although not Primary or Backup Masters, they can be placed into these roles when these other two roles fail or are removed from the stack. Slave switches perform operations requested by the master, monitor the status of neighbor switches in the stack and the stack topology and adhere to the Backup Master's commands once it becomes a Primary Master. Slave switches will do a self-check to determine if it is to become the Backup Master if the Backup Master is promoted to the Primary Master, or if the Backup Master fails or is removed from the switch stack. If both Primary and Backup masters fail, or are removed from the Switch stack, it will determine if it is to become the Primary Master. These roles will be determined, first by priority and if the priority is the same, the lowest MAC address.

Once switches have been assembled in the topology desired by the user and powered on, the stack will undergo three processes until it reaches a functioning state.

**Initialization State** – This is the first state of the stack, where the runtime codes are set and initialized and the system conducts a peripheral diagnosis to determine each individual switch is functioning properly.

**Master Election State** – Once the codes are loaded and initialized, the stack will undergo the Master Election State where it will discover the type of topology used, elect a Primary Master and then a Backup Master.

**Synchronization State** – Once the Primary Master and the Backup Master have been established, the Primary Master will assign Stacking Unit IDs to switches in the stack, synchronize configurations for all switches and then transmit commands to the rest of the switches based on the users configurations of the Primary Master.

Once these steps have been completed, the switch stack will enter a normal operating mode.

## Stack Switch Swapping

The stacking feature of the Switch supports “hot swapping” of switches in and out of the running stack. Users may remove or add switches to the stack without powering down or largely affecting the transfer of data between switches in the stack, with a few minor provisions.

When switches are “hot inserted” into the running stack, the new switch may take on the Primary Master, Backup Master or Slave role, depending on configurations set on the newly added switch, such as configured priority or MAC address. Yet, if adding two stacks together that have both previously undergone the election process, and therefore both have a Primary Master and a Backup master, a new Primary Master will be elected from one of the already existing Primary Masters, based on priority or MAC address. This Primary Master will take over all of the Primary Master’s roles for all new switches that were hot inserted. This process is done using discovery packets that circulate through the switch stack every 1.5 seconds until the discovery process has been completed.

The “hot remove” action means removing a device from the stack while the stack is still running. The hot removal is detected by the stack when it fails to receive heartbeat packets during its specified interval from a device, or when one of the stacking ports links is down. Once the device has been removed, the remaining switches will update their stacking topology database to reflect the change. Any one of the three roles, Primary Master, Backup Master or Slave, may be removed from the stack, yet different processes occur for each specific device removal.

If a Slave device has been removed, the Primary Master will inform other switches of the hot remove of this device through the use of unit leave messages. Switches in the stack will clear the configurations of the unit removed, and dynamically learned databases, such as ARP, will be cleared as well.

If the Backup Master has been hot removed, a new Backup Master will be chosen through the election process previously described. Switches in the stack will clear the configurations of the unit removed, and dynamically learned databases, such as ARP, will be cleared as well. Then the Backup Master will begin backing up the Primary Master when the database synchronization has been completed by the stack.

If the Primary Master is removed, the Backup Master will assume the Primary Master’s role and a new Backup Master will be chosen using the election process. Switches in the stack will clear the configurations of the unit removed, and dynamically learned databases, such as ARP, will be cleared as well. The new Primary Master will inherit the MAC and IP address of the previous Primary Master to avoid conflict within the stack and the network itself.

If both the Primary Master and the Backup Master are removed, the election process is immediately processed and a new Primary Master and Backup Master is determined. Switches in the stack will clear the configurations of the units removed, and dynamically learned databases, such as ARP, will be cleared as well. Static switch configurations still remain in the database of the remaining switches in the stack and those functions will not be affected.

**NOTE:** If there is a Box ID conflict when the stack is in the discovery phase, the device will enter a special standalone topology mode. Users can only get device information, configure Box IDs, save and reboot. All stacking ports will be disabled and an error message will be produced on the local console port of each device in the stack. Users must reconfigure Box IDs and reboot the stack.

## Stacking Device Table

This window is used to display the current devices in the Switch Stack.

To view this window, click **System Configuration > Stacking > Stacking Device Table**, as shown below:

Stacking Device Table				Safeguard
Box ID	Box Type	HW Version	Serial Number	
1	DGS-3420-28SC	B1		

Figure 2-33 Stacking Device Table window

## Stacking Mode Settings

To begin the stacking process, users must first enable this device for stacking by using the Stacking Mode Settings window.

To view this window, click **System Configuration > Stacking > Stacking Mode Settings**, as shown below:

The screenshot shows the 'Stacking Mode Settings' window. At the top right is a 'Safeguard' button. Below it are four sections with radio buttons for 'Enabled' or 'Disabled': 'Stacking Mode' (radio button for 'Disabled' is selected), 'Force Master Role' (radio button for 'Disabled' is selected), 'Stacking Trap State' (radio button for 'Enabled' is selected), and 'Stacking Log State' (radio button for 'Enabled' is selected). Each section has an 'Apply' button to its right. Below these is a 'Box ID Settings' section with dropdown menus for 'Current Box ID' (set to 1) and 'New Box ID' (set to 'Auto'), and a text input field for 'Priority (1-63)' with a value of '1'. This section also has an 'Apply' button.

**Figure 2-34 Stacking Mode Settings window**

The fields that can be configured or viewed are described below:

Parameter	Description
<b>Stacking Mode</b>	The stacking mode is disabled by default.
<b>Force Master Role</b>	Use the radio buttons to enable or disable the function. It is used to ensure the master role is unchanged when adding a new device to the current stacking topology. If the <b>Enabled</b> radio button is selected, the master's priority will become zero after the stacking has stabilized.
<b>Stacking Trap State</b>	Specifies that the traps will be sent for stacking.
<b>Stacking Log State</b>	Specifies that the logs will be sent for stacking.
<b>Current Box ID</b>	The Box ID of the switch in the stack to be configured.
<b>New Box ID</b>	The new box ID of the selected switch in the stack that was selected in the Current Box ID field. The user may choose any number between 1 and 12 to identify the switch in the switch stack. <i>Auto</i> will automatically assign a box number to the switch in the switch stack.
<b>Priority (1-63)</b>	Displays the priority ID of the Switch. The lower the number, the higher the priority. The box (switch) with the lowest priority number in the stack is the Primary Master switch. The Primary Master switch will be used to configure applications of the switch stack.

Click the **Apply** button to accept the changes made.

# Chapter 3 Management

## **ARP**

### **Gratuitous ARP**

### **IPv6 Neighbor Settings**

### **IP Interface**

### **Management Settings**

#### **Out of Band Management Settings**

#### **Session Table**

#### **Single IP Management**

#### **SNMP Settings**

#### **Telnet Settings**

#### **Power Saving**

## ARP

### Static ARP Settings

The Address Resolution Protocol is a TCP/IP protocol that converts IP addresses into physical addresses. This table allows network managers to view, define, modify, and delete ARP information for specific devices. Static entries can be defined in the ARP table. When static entries are defined, a permanent entry is entered and is used to translate IP addresses to MAC addresses.

To view the following window, click **Management > ARP > Static ARP Settings**, as show below:

The screenshot shows the 'Static ARP Settings' window with the following interface elements:

- Global Settings:** Includes a field for 'ARP Aging Time (0-65535)' set to 20 min, and an 'Apply' button.
- Add Static ARP Entry:** Fields for 'IP Address' and 'MAC Address', and an 'Apply' button.
- Total Entries: 3:** A table listing three static ARP entries:

Interface Name	IP Address	MAC Address	Type	Edit	Delete
System	192.168.69.0	FF-FF-FF-FF-FF-FF	Local/Broadcast	Edit	Delete
System	192.168.69.123	00-01-02-03-04-00	Local	Edit	Delete
System	192.168.69.255	FF-FF-FF-FF-FF-FF	Local/Broadcast	Edit	Delete

Figure 3-1 Static ARP Settings window

The fields that can be configured are described below:

Parameter	Description
<b>ARP Aging Time (0-65535)</b>	The ARP entry age-out time, in minutes. The default is 20 minutes.
<b>IP Address</b>	The IP address of the ARP entry.

<b>MAC Address</b>	The MAC address of the ARP entry.
--------------------	-----------------------------------

Click the **Apply** button, located in the **Global Settings** section to accept the changes made in this section.

Click the **Apply** button, located in the **Add Static ARP Entry** section to accept the changes made in this section.

Click the **Delete All** button to remove all the entries listed.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

# Proxy ARP Settings

The Proxy ARP (Address Resolution Protocol) feature of the Switch will allow the Switch to reply to ARP requests destined for another device by faking its identity (IP and MAC Address) as the original ARP responder. Therefore, the Switch can then route packets to the intended destination without configuring static routing or a default gateway.

The host, usually a layer 3 switch, will respond to packets destined for another device. For example, if hosts A and B are on different physical networks, B will not receive ARP broadcast requests from A and therefore cannot respond.

Yet, if the physical network of A is connected by a router or layer 3 switch to B, the router or Layer 3 switch will see the ARP request from A.

This local proxy ARP function allows the Switch to respond to the proxy ARP, if the source IP and destination IP are in the same interface.

To view the following window, click **Management > ARP > Proxy ARP Settings**, as show below:

Proxy ARP Settings			
<input checked="" type="checkbox"/> Safeguard			
<b>Total Entries: 1</b>			
Interface Name	Proxy ARP State	Local Proxy ARP State	
System	Disabled	Disabled	<input type="button" value="Edit"/>

**Figure 3-2 Proxy ARP Settings window**

Click the **Edit** button to re-configure the specific entry and select the proxy ARP state of the IP interface. By default, both the **Proxy ARP State** and **Local Proxy ARP State** are disabled.

## ARP Table

Users can display current ARP entries on the Switch.

To view the following window, click **Management > ARP > ARP Table**, as show below:

ARP Table			
Interface Name	IP Address	MAC Address	Find
System	192.168.69.0	FF-FF-FF-FF-FF-FF	Local/Broadcast
System	192.168.69.66	00-23-7D-BC-2E-18	Dynamic
System	192.168.69.123	00-01-02-03-04-00	Local
System	192.168.69.255	FF-FF-FF-FF-FF-FF	Local/Broadcast

**Figure 3-3 ARP Table window**

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Enter or view the Interface name used.
<b>IP Address</b>	Enter or view the IP Address used.
<b>MAC Address</b>	Enter or view the MAC Address used.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Show Static** button to display only the static entries in the display table.

Click the **Clear All** button to remove all the entries listed in the table.

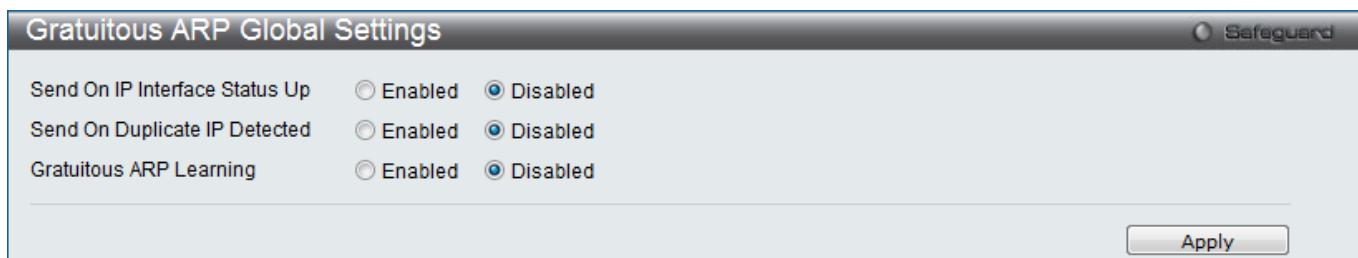

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## Gratuitous ARP

### Gratuitous ARP Global Settings

The user can enable or disable the gratuitous ARP global settings here.

To view the following window, click **Management > Gratuitous ARP > Gratuitous ARP Global Settings**, as show below:

**Figure 3-4 Gratuitous ARP Global Settings Window**

The fields that can be configured are described below:

Parameter	Description
<b>Send On IP Interface Status Up</b>	The command is used to enable/disable sending of gratuitous ARP request packet while the IPIF interface become up. This is used to automatically announce the interface's IP address to other nodes. By default, the state is disabled, and only one gratuitous ARP packet will be broadcast.
<b>Send On Duplicate IP Detected</b>	The command is used to enable/disable the sending of gratuitous ARP request packet while a duplicate IP is detected. By default, the state is disabled. For this command, the duplicate IP detected means that the system received an ARP request packet that is sent by an IP address that match the system's own IP address. In this case, the system knows that somebody out there uses an IP address that is conflict with the system. In order to reclaim the correct host of this IP address, the system can send out the gratuitous ARP request packets for this duplicate IP address.
<b>Gratuitous ARP Learning</b>	Normally, the system will only learn the ARP reply packet or a normal ARP request packet that asks for the MAC address that corresponds to the system's IP address. The command is used to enable/disable learning of ARP entry in ARP cache based on the received gratuitous ARP packet. The gratuitous ARP packet is sent by a source IP

	address that is identical to the IP that the packet is queries for. By default, the state is Disabled status.
--	---

Click the **Apply** button to accept the changes made.

**NOTE:** With the gratuitous ARP learning, the system will not learn new entry but only do the update on the ARP table based on the received gratuitous ARP packet.

## Gratuitous ARP Settings

The user can configure the IP interface's gratuitous ARP parameter.

To view the following window, click **Management > Gratuitous ARP > Gratuitous ARP Settings**, as show below:

The screenshot shows the 'Gratuitous ARP Settings' window. It has two main sections: 'Gratuitous ARP Trap/Log' and 'Gratuitous ARP Periodical Send Interval'. In the 'Trap/Log' section, 'Trap' is set to 'Disabled' and 'Log' is set to 'Enabled'. Under 'Interface Name', there is a dropdown menu and a checkbox for 'All'. An 'Apply' button is present. In the 'Periodical Send Interval' section, there are fields for 'Interface Name' and 'Interval Time (0-65535)'. An 'Apply' button is also here. At the bottom, a table shows 'Total Entries: 1' with one row for 'System' where 'Gratuitous ARP Trap' is 'Disabled' and 'Gratuitous ARP Log' is 'Enabled'. The 'Gratuitous ARP Periodical Send Interval' column shows '0'.

Figure 3-5 Gratuitous ARP Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Trap</b>	Use the drop-down menu to enable or disable the trap option. By default the trap is disabled.
<b>Log</b>	Use the drop-down menu to enable or disable the logging option. By default the event log is enabled.
<b>Interface Name</b>	Enter the interface name of the Layer 3 interface. Select <b>All</b> to enable or disable gratuitous ARP trap or log on all interfaces.
<b>Interval Time (0-65535)</b>	Enter the periodically send gratuitous ARP interval time in seconds. 0 means that gratuitous ARP request will not be sent periodically. By default the interval time is 0.

Click the **Apply** button, located in the **Gratuitous ARP Trap/Log** section to accept the changes made in this section.

Click the **Apply** button, located in the **Gratuitous ARP Periodical Send Interval** section to accept the changes made in this section.

## IPv6 Neighbor Settings

The user can configure the Switch's IPv6 neighbor settings. The Switch's current IPv6 neighbor settings will be displayed in the table at the bottom of this window.

To view the following window, click **Management > IPv6 Neighbor Settings**, as show below:

The screenshot shows the 'IPv6 Neighbor Settings' window. At the top, there are input fields for 'Interface Name', 'Neighbor IPv6 Address', and 'Link Layer MAC Address'. Below these are search/filter controls: 'Interface Name' dropdown with 'All' selected, a checked 'All' checkbox, an unchecked 'Hardware' checkbox, and buttons for 'Add', 'Find', and 'Clear'. A message 'Total Entries: 0' is displayed above a table header row. The table has columns: 'Neighbor', 'Link Layer Address', 'Interface Name', 'State', 'Port', and 'VID'. A note at the bottom explains the 'State' field options: (I) Incomplete, (R) Reachable, (S) Stale, (D) Delay, (P) Probe, and (T) Static.

**Total Entries: 0**

Neighbor	Link Layer Address	Interface Name	State	Port	VID
----------	--------------------	----------------	-------	------	-----

**State:** (I) means Incomplete state. (R) means Reachable state. (S) means Stale state.  
(D) means Delay state. (P) means Probe state. (T) means Static state.

Figure 3-6 IPv6 Neighbor Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Enter the interface name of the IPv6 neighbor.
<b>Neighbor IPv6 Address</b>	Enter the neighbor IPv6 address.
<b>Link Layer MAC Address</b>	Enter the link layer MAC address.
<b>Interface Name</b>	Enter the interface name of the IPv6 neighbor. Tick the <b>All</b> check box to search for all current interfaces on the Switch. Tick the <b>Hardware</b> check box to display all the neighbor cache entries which were written into the hardware table.
<b>State</b>	Use the drop-down menu to select All, Address, Static, or Dynamic. When the user selects address from the drop-down menu, the user will be able to enter an IPv6 address in the space provided next to the state option.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Clear** button to clear all the information entered in the fields.

## IP Interface

## System IP Address Settings

The IP address may initially be set using the console interface prior to connecting to it through the Ethernet. The Web manager will display the Switch's current IP settings.

**NOTE:** The Switch's factory default IP address is 10.90.90.90 with a subnet mask of 255.0.0.0 and a default gateway of 0.0.0.0.

To view the following window, click **Management > IP Interface > System IP Address Settings**, as show below:

Figure 3-7 System IP Address Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Static</b>	Allow the entry of an IP address, subnet mask, and a default gateway for the Switch. These fields should be of the form xxx.xxx.xxx.xxx, where each xxx is a number (represented in decimal form) between 0 and 255. This address should be a unique address on the network assigned for use by the network administrator.
<b>DHCP</b>	The Switch will send out a DHCP broadcast request when it is powered up. The DHCP protocol allows IP addresses, network masks, and default gateways to be assigned by a DHCP server. If this option is set, the Switch will first look for a DHCP server to provide it with this information before using the default or previously entered settings.
<b>BOOTP</b>	The Switch will send out a BOOTP broadcast request when it is powered up. The BOOTP protocol allows IP addresses, network masks, and default gateways to be assigned by a central BOOTP server. If this option is set, the Switch will first look for a BOOTP server to provide it with this information before using the default or previously entered settings.

The following table will describe the fields that are about the **System** Interface.

Parameter	Description
-----------	-------------

<b>Interface Name</b>	Display the System interface name.
<b>Management VLAN Name</b>	This allows the entry of a VLAN name that belongs to the System interface.
<b>Interface Admin State</b>	Use the drop-down menu to enable or disable the configuration on this interface. If the state is disabled, the IP interface cannot be accessed.
<b>IP Address</b>	This field allows the entry of an IPv4 address to be assigned to this IP interface.
<b>Subnet Mask</b>	A Bitmask that determines the extent of the subnet that the Switch is on. Should be of the form xxx.xxx.xxx.xxx, where each xxx is a number (represented in decimal) between 0 and 255. The value should be 255.0.0.0 for a Class A network, 255.255.0.0 for a Class B network, and 255.255.255.0 for a Class C network, but custom subnet masks are allowed.
<b>Gateway</b>	IP address that determines where packets with a destination address outside the current subnet should be sent. This is usually the address of a router or a host acting as an IP gateway. If your network is not part of an intranet, or you do not want the Switch to be accessible outside your local network, you can leave this field unchanged.

Click the **Apply** button to accept the changes made.

## Interface Settings

Users can display the Switch's current IP interface settings.

To view the following window, click **Management > IP Interface > Interface Settings**, as show below:

Total Entries: 1					
Interface Name	VLAN Name	Interface Admin State	Secondary	Link State	
System	default	Enabled	No	Link Up	<a href="#">IPv4 Edit</a> <a href="#">IPv6 Edit</a> <a href="#">Delete</a>

Figure 3-8 Interface Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Enter the name of the IP interface to search for.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

Click the **IPv4 Edit** button to edit the IPv4 settings for the specific entry.

Click the **IPv6 Edit** button to edit the IPv6 settings for the specific entry.

Click the **Delete** button to remove the specific entry.

**NOTE:** To create IPv6 interfaces, the user has to create an IPv4 interface then edit it to IPv6.

Click the **Add** button to see the following window.

The screenshot shows the 'IPv4 Interface Settings' window. It contains the following fields:

- Interface Name:** A text input field with a placeholder '(Max: 12 characters)'.
- IPv4 Address:** A text input field with a placeholder '(e.g.: 172.18.211.10)'.
- Subnet Mask:** A text input field with a placeholder '(e.g.: 255.255.255.254 or 0-32)'.
- VLAN Name:** A text input field with a placeholder '(Max: 32 characters)'.
- Interface Admin State:** A dropdown menu set to 'Enabled'.
- Secondary Interface:** A checkbox.

At the bottom right are two buttons: '<<Back' and 'Apply'.

Figure 3-9 IPv4 Interface Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Enter the name of the IP interface being created.
<b>IPv4 Address</b>	Enter the IPv4 address used.
<b>Subnet Mask</b>	Enter the IPv4 subnet mask used.
<b>VLAN Name</b>	Enter the VLAN Name used.
<b>Interface Admin State</b>	Use the drop-down menu to enable or disable the Interface Admin State.
<b>Secondary Interface</b>	Tick the check box to use this Interface as a Secondary Interface. When the primary IP is not available, the VLAN will switch to the secondary interface. It will switch back when the primary IP was recovered.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the **IPv4 Edit** button to see the following window.

The screenshot shows the 'IPv4 Interface Settings - Edit' window. It contains the following fields:

- IP MTU (512-1712):** A text input field with a value of '1500'.
- IP Directed Broadcast:** A dropdown menu set to 'Disabled'.
- Get IP From:** A dropdown menu set to 'Static'.
- Interface Name:** A text input field with a value of 'System'.
- IPv4 Address:** A text input field with a value of '10.90.90.90' and a placeholder '(e.g.: 172.18.211.10)'.
- Subnet Mask:** A text input field with a value of '255.0.0.0' and a placeholder '(e.g.: 255.255.255.254 or 0-32)'.
- VLAN Name:** A text input field with a value of 'default'.
- IPv4 State:** A dropdown menu set to 'Enabled'.
- Interface Admin State:** A dropdown menu set to 'Enabled'.
- DHCP Option12 State:** A dropdown menu set to 'Disabled'.
- DHCP Option12 Host Name:** A text input field with a placeholder '(Max: 63 characters)'.

At the bottom right are two buttons: '<<Back' and 'Apply'.

Figure 3-10 IPv4 Interface Settings – Edit window

The fields that can be configured are described below:

Parameter	Description
<b>IP MTU (512-1712)</b>	Enter the IP Layer MTU value used. The value is between 512 and 1712. The default value is 1500.
<b>IP Directed Broadcast</b>	Select the IP directed broadcast option. This specifies to enable or disable the IP directed-broadcast state of a specified interface.
<b>Get IP From</b>	Use the drop-down menu to specify the method that this Interface uses to acquire an IP address.
<b>Interface Name</b>	Enter the name of the IP interface being configured.
<b>IPv4 Address</b>	Enter the IPv4 address used.
<b>Subnet Mask</b>	Enter the IPv4 subnet mask used.
<b>VLAN Name</b>	Enter the VLAN Name used.
<b>IPv4 State</b>	Use the drop-down menu to enable or disable IPv4 State.
<b>Interface Admin State</b>	Use the drop-down menu to enable or disable the Interface Admin State.
<b>DHCP Option 12 State</b>	Use the drop-down menu to enable or disable insertion of option 12 in the DHCPDISCOVER and DHCPREQUEST message.
<b>DHCP Option 12 Host Name</b>	Enter the host name to be inserted in the DHCPDISCOVER and DHCPREQUEST message.

Click the **Apply** button to accept the changes made for each individual section.

Click the <<Back button to discard the changes made and return to the previous page.

Click the **IPv6 Edit** button to see the following window.

**IPv6 Interface Settings**

Interface Name	System	IPv6 State	Enabled	Interface Admin State	Enabled
IPv6 Network Address	(e.g.: 3710::1/64)			Prefix Name	(Max.: 12 characters)
DHCPv6 Client PD State	Disabled			DHCPv6 Client PD Prefix Name	(Max.: 12 characters)
DHCPv6 Client	Disabled				

**Apply**

---

**NS Retransmit Time Settings**

NS Retransmit Time (0-4294967295)	0 ms	<b>Apply</b>
-----------------------------------	------	--------------

---

**Automatic Link Local State Settings**

Automatic Link Local Address	Disabled	<b>Apply</b>
------------------------------	----------	--------------

---

**Router Advertisement Settings**

State	Disabled	Life Time (0-9000)	1800 sec
Reachable Time (0-3600000)	1200000	Retransmit Time (0-4294967295)	0 ms
Hop Limit (0-255)	64	Managed Flag	Disabled
Other Configuration Flag	Disabled	Min Router AdvInterval (3-1350)	198 sec
Max Router AdvInterval (4-1800)	600 sec

[View All IPv6 Address](#)  
[View Neighbor Discover](#)

Figure 3-11 IPv6 Interface Settings window

The fields that can be configured or displayed are described below:

Parameter	Description
<b>Interface Name</b>	Display the IPv6 interface name.
<b>IPv6 State</b>	Use the drop-down menu to enable or disable IPv6 State.
<b>Interface Admin State</b>	Use the drop-down menu to enable or disable the Interface Admin State.
<b>IPv6 Network Address</b>	Enter the interface's global or link local address.
<b>Prefix Name</b>	Enter the IPv6 prefix name used here.
<b>DCHPv6 Client PD State</b>	Select to enable or disable the DCHPv6 client PD state of the interface.
<b>DCHPv6 Client PD Prefix Name</b>	Enter the DCHPv6 client PD prefix name used here.
<b>DCHPv6 Client</b>	Select to enable or disable the DCHPv6 client option here.
<b>NS Retransmit Time (0-4294967295)</b>	Enter the Neighbor solicitation's retransmit timer in millisecond here. It has the same value as the RA retransmit time in the config ipv6 nd ra command. If this field is configured, it will duplicate the entry into the RA field.
<b>Automatic Link Local Address</b>	Use the drop-down menu to enable or disable the Automatic Link Local Address.
<b>State</b>	Use the drop-down menu to enable or disable router advertisement.
<b>Life Time (0-9000)</b>	Enter the lifetime of the router between 0 and 9000 seconds as the default router.
<b>Reachable Time (0-3600000)</b>	Enter the amount of time that a node can consider a neighboring node reachable after receiving a reachability confirmation, in milliseconds.
<b>Retransmit Time (0-4294967295)</b>	Enter the amount of time between retransmissions of router advertisement message in millisecond, and the router advertisement packet will take it to host.
<b>Hop Limit (0-255)</b>	Enter the default value of the hop limit field in the IPv6 header for packets sent by hosts that receive this RA message.
<b>Managed Flag</b>	Use the drop-down menu to enable or disable the function. When Enabled, it indicates that hosts receiving this RA must use a stateful address configuration protocol to obtain an address, in addition to the addresses derived from the stateless address configuration. Set to Disabled to stop hosts receiving the RA from using a stateful address configuration to obtain an address.
<b>Other Configuration Flag</b>	Use the drop-down menu to enable or disable the function. When Enabled, it indicates that hosts receiving this RA must use a stateful address configuration protocol to obtain the address configuration information. Set to Disabled to stop hosts receiving this RA from using a stateful address configuration protocol to obtain the address configuration information.
<b>Min Router AdvInterval (3-1350)</b>	Enter the minimum time allowed between sending unsolicited multicast Router Advertisements from the interface, in seconds. It must be no less than 3 seconds and no greater than .75 * MaxRtrAdvInterval. The default is 0.33 * MaxRtrAdvInterval.
<b>Max Router AdvInterval (4-1800)</b>	Enter the maximum time allowed between sending unsolicited multicast Router Advertisements from the interface, in seconds. It must be no less than 4 seconds and no greater than 1800 seconds. The default is 600 seconds.

Click the **Apply** button to accept the changes made for each individual section.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the [View All IPv6 Address](#) link to view all the current IPv6 address.

Figure 3-13 IPv6 Interface Settings – View Neighbor Discover window

Click the **<<Back** button to return to the previous page.

## Loopback Interface Settings

This window is used to configure loopback interfaces. A loopback interface is a logical IP interface which is always active, until a user disables or deletes it. It is independent of the state of any physical interfaces.

To view this window, click **Management > IP Interface > Loopback Interfaces Settings**, as show below:

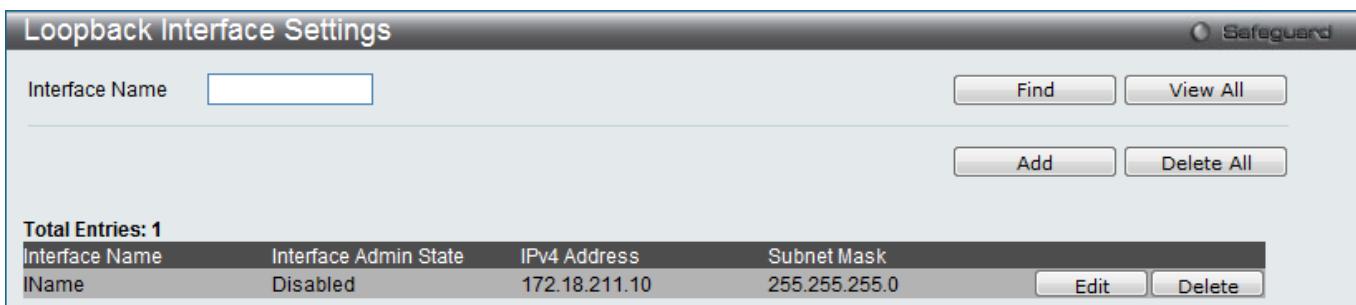

Figure 3-14 Loopback Interface Settings window

The fields that can be configured are described below:

Parameter	Description
Interface Name	Enter an interface name.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Add** button to create a new entry.

Click the **Delete All** button to remove all the entries listed in the table.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

Click the **Add** or **Edit** button to see the following window.

Figure 3-15 Loopback Interface Settings - Add/Edit window

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	The name of the loopback interface. <b>NOTE:</b> The loopback ipif has the same name domain space with the regular ipif, so its name can't be a duplicate with the regular ipif.
<b>IPv4 Address</b>	Enter a 32-bit IPv4 address for the loopback interface.
<b>Subnet Mask</b>	Enter a subnet mask to be applied to the loopback interface.
<b>Interface Admin State</b>	Use the drop-down menu to enable or disable the loopback interface.

Click the **Apply** button to accept the changes made for each individual section.

Click the **<<Back** button to discard the changes made and return to the previous page.

## Management Settings

Users can stop the scrolling of multiple pages beyond the limits of the console when using the Command Line Interface.

This window is also used to enable the DHCP auto configuration feature on the Switch. When enabled, the Switch is instructed to receive a configuration file from a TFTP server, which will set the Switch to become a DHCP client automatically on boot-up. To employ this method, the DHCP server must be set up to deliver the TFTP server IP address and configuration file name information in the DHCP reply packet. The TFTP server must be up and running and hold the necessary configuration file stored in its base directory when the request is received from the Switch. For more information about loading a configuration file for use by a client, see the DHCP server and/or TFTP server software instructions. The user may also consult the **Upload Log File** window description located in the **Tools** section of this manual.

If the Switch is unable to complete the DHCP auto configuration, the previously saved configuration file present in the Switch's memory will be used.

Users can also configure Password Encryption on the Switch.

To view the following window, click **Management > Management Settings**, as show below:

The Management Settings window displays several configuration options:

- CLI Paging Settings**
  - CLI Paging State: Enabled (radio button selected)
  - DHCP Auto Configuration Settings
    - DHCP Auto Configuration State: Disabled (radio button selected)
- Password Encryption Settings**
  - Password Encryption State: Disabled (radio button selected)
- Password Recovery Settings**
  - Running Configuration: Enabled (radio button selected)
  - NV-RAM Configuration: Enabled

**Apply**

**Figure 3-16 Management Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>CLI Paging State</b>	Command Line Interface paging stops each page at the end of the console. This allows you to stop the scrolling of multiple pages of text beyond the limits of the console. CLI Paging is Enabled by default. To disable it, click the Disabled radio button.
<b>DHCP Auto Configuration State</b>	Enable or disable the Switch's DHCP auto configuration feature. When enabled, the Switch is instructed to receive a configuration file from a TFTP server, which will set the Switch to become a DHCP client automatically on boot-up. To employ this method, the DHCP server must be set up to deliver the TFTP server IP address and configuration file name information in the DHCP reply packet. The TFTP server must be up and running and hold the necessary configuration file stored in its base directory when the request is received from the Switch.
<b>Password Encryption State</b>	Password encryption will encrypt the password configuration in configuration files. Password encryption is Disabled by default. To enable password encryption, click the Enabled radio button.
<b>Running Configuration</b>	Under the Password Recovery option, the running configuration can be enabled or disable. Being enabled, will allow the user to perform a password recovery of the running configuration.

Click the **Apply** button to accept the changes made.

## Out of Band Management Settings

This window is used to configure the out of band management port settings.

To view the following window, click **Management > Out of Band Management Settings**, as show below:

The Out of Band Management Settings window displays the following configuration fields:

- IP Address: 192.168.0.1
- Subnet Mask: 255.255.255.0
- Gateway: 0.0.0.0
- Status: Enabled
- Link Status: Link Down

**Apply**

**Figure 3-17 Out of Band management Settings window**

The fields that can be configured are described below:

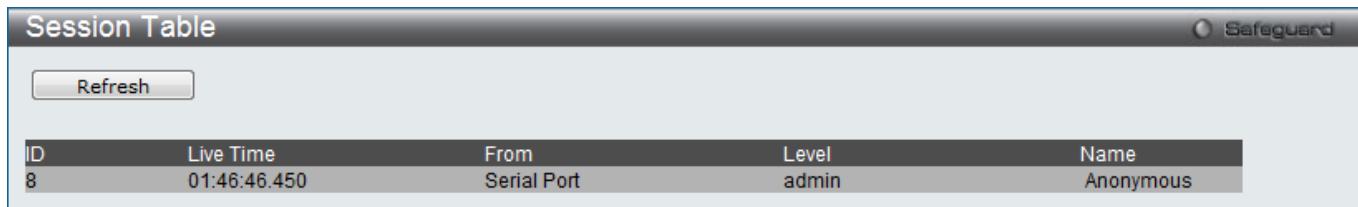

Parameter	Description
<b>IP Address</b>	Enter the IP address of the interface.
<b>Subnet Mask</b>	Enter the subnet mask of the IP address.
<b>Gateway</b>	Enter the gateway IP address of the out-of-band management network.
<b>Status</b>	Use the drop-down menu to enable or disable the interface status.

Click the **Apply** button to accept the changes made.

## Session Table

Users can display the management sessions since the Switch was last rebooted.

To view the following window, click **Management > Session Table**, as show below:

The screenshot shows a table titled "Session Table". At the top left is a "Refresh" button. On the right side of the title bar is a "Safeguard" icon. The table has five columns: ID, Live Time, From, Level, and Name. There is one row of data: ID 8, Live Time 01:46:46.450, From Serial Port, Level admin, and Name Anonymous.

ID	Live Time	From	Level	Name
8	01:46:46.450	Serial Port	admin	Anonymous

**Figure 3-18 Session Table window**

Click the **Refresh** button to refresh the display table so that new entries will appear.

## Single IP Management

Simply put, D-Link Single IP Management is a concept that will stack switches together over Ethernet instead of using stacking ports or modules. There are some advantages in implementing the “Single IP Management” feature:

1. SIM can simplify management of small workgroups or wiring closets while scaling the network to handle increased bandwidth demand.
2. SIM can reduce the number of IP address needed in your network.
3. SIM can eliminate any specialized cables for stacking connectivity and remove the distance barriers that typically limit your topology options when using other stacking technology.

Switches using D-Link Single IP Management (labeled here as SIM) must conform to the following rules:

- SIM is an optional feature on the Switch and can easily be enabled or disabled through the Command Line Interface or Web Interface. SIM grouping has no effect on the normal operation of the Switch in the user's network.
- There are three classifications for switches using SIM. The **Commander Switch (CS)**, which is the master switch of the group, **Member Switch (MS)**, which is a switch that is recognized by the CS a member of a SIM group, and a **Candidate Switch (CaS)**, which is a Switch that has a physical link to the SIM group but has not been recognized by the CS as a member of the SIM group.
- A SIM group can only have one Commander Switch (CS).
- A SIM group accepts up to 32 switches (numbered 1-32), not including the Commander Switch (numbered 0).
- Members of a SIM group cannot cross a router.
- There is no limit to the number of SIM groups in the same IP subnet (broadcast domain); however a single switch can only belong to one group.

- If multiple VLANs are configured, the SIM group will only utilize the default VLAN on any switch.
- SIM allows intermediate devices that do not support SIM. This enables the user to manage switches that are more than one hop away from the CS.

The SIM group is a group of switches that are managed as a single entity. The Switch may take on three different roles:

1. **Commander Switch (CS)** – This is a switch that has been manually configured as the controlling device for a group, and takes on the following characteristics:
  - a. It has an IP Address.
  - b. It is not a command switch or member switch of another Single IP group.
  - c. It is connected to the member switches through its management VLAN.
2. **Member Switch (MS)** – This is a switch that has joined a single IP group and is accessible from the CS, and it takes on the following characteristics:
  - a. It is not a CS or MS of another IP group.
  - b. It is connected to the CS through the CS management VLAN.
3. **Candidate Switch (CaS)** – This is a switch that is ready to join a SIM group but is not yet a member of the SIM group. The Candidate Switch may join the SIM group of the Switch by manually configuring it to be a MS of a SIM group. A switch configured as a CaS is not a member of a SIM group and will take on the following characteristics:
  - a. It is not a CS or MS of another Single IP group.
  - b. It is connected to the CS through the CS management VLAN

The following rules also apply to the above roles:

- Each device begins in a Candidate state.
- CSs must change their role to CaS and then to MS, to become a MS of a SIM group. Thus, the CS cannot directly be converted to a MS.
- The user can manually configure a CS to become a CaS.
- A MS can become a CaS by:
  - o Being configured as a CaS through the CS.
  - o If report packets from the CS to the MS time out.
- The user can manually configure a CaS to become a CS
- The CaS can be configured through the CS to become a MS.

After configuring one switch to operate as the CS of a SIM group, additional DGS-3420 Series switches may join the group by manually configuring the Switch to be a MS. The CS will then serve as the in band entry point for access to the MS. The CS's IP address will become the path to all MS's of the group and the CS's Administrator's password, and/or authentication will control access to all MS's of the SIM group.

With SIM enabled, the applications in the CS will redirect the packet instead of executing the packets. The applications will decode the packet from the administrator, modify some data, and then send it to the MS. After execution, the CS may receive a response packet from the MS, which it will encode and send it back to the administrator.

When a CaS becomes a MS, it automatically becomes a member of the first SNMP community (includes read/write and read only) to which the CS belongs. However, if a MS has its own IP address, it can belong to SNMP communities to which itself belongs to.

## Single IP Settings

The Switch is set as a Candidate (CaS) as the factory default configuration and Single IP Management is disabled.

To view the following window, click **Management > Single IP Management > Single IP Settings**, as show below:

Figure 3-19 Single IP Settings window

The fields that can be configured are described below:

Parameter	Description
<b>SIM State</b>	Use the drop-down menu to either enable or disable the SIM state on the Switch. <i>Disabled</i> will render all SIM functions on the Switch inoperable.
<b>Role State</b>	Use the drop-down menu to change the SIM role of the Switch. The two choices are: <i>Candidate</i> – A Candidate Switch (CaS) is not the member of a SIM group but is connected to a Commander Switch. This is the default setting for the SIM role of the Switch. <i>Commander</i> – Choosing this parameter will make the Switch a Commander Switch (CS). The user may join other switches to this Switch, over Ethernet, to be part of its SIM group. Choosing this option will also enable the Switch to be configured for SIM.
<b>Group Name</b>	Enter a Group Name in this textbox. This is optional. This name is used to segment switches into different SIM groups.
<b>Discovery Interval (30-90)</b>	The user may set the discovery protocol interval, in seconds that the Switch will send out discovery packets. Returning information to a Commander Switch will include information about other switches connected to it. (Ex. MS, CaS). The user may set the Discovery Interval from 30 to 90 seconds. The default value is 30 seconds.
<b>Hold Time Count (100-255)</b>	This parameter may be set for the time, in seconds; the Switch will hold information sent to it from other switches, utilizing the Discovery Interval. The user may set the hold time from 100 to 255 seconds. The default value is 100 seconds.

Click the **Apply** button to accept the changes made.

After enabling the Switch to be a Commander Switch (CS), the **Single IP Management** folder will then contain four added links to aid the user in configuring SIM through the web, including **Topology**, **Firmware Upgrade**, **Configuration Backup/Restore** and **Upload Log File**.

## Topology

This window will be used to configure and manage the Switch within the SIM group and requires Java script to function properly on your computer.

The Java Runtime Environment on your server should initiate and lead you to the Topology window, as seen below.

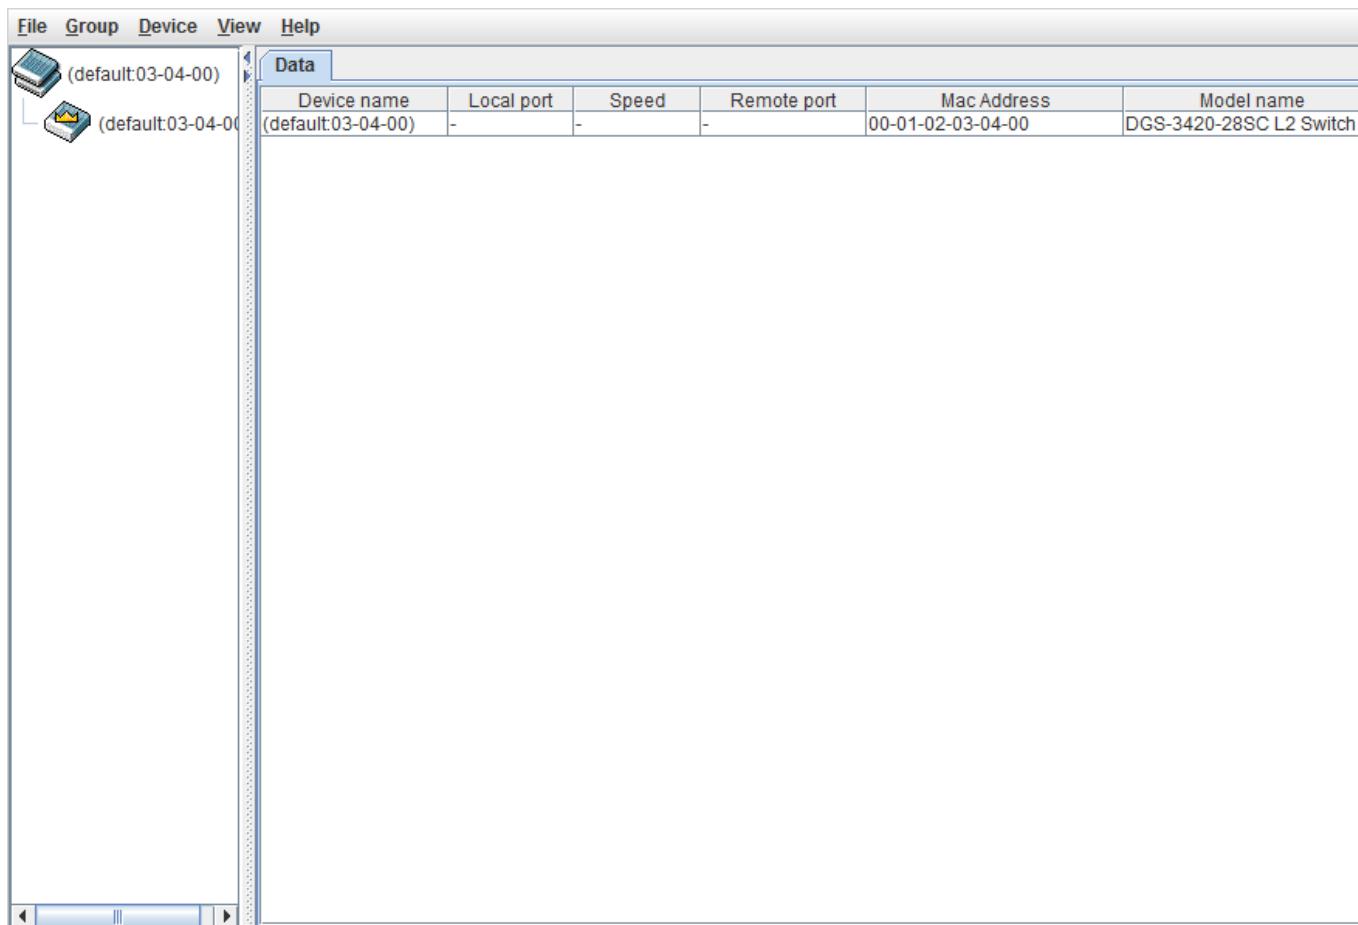

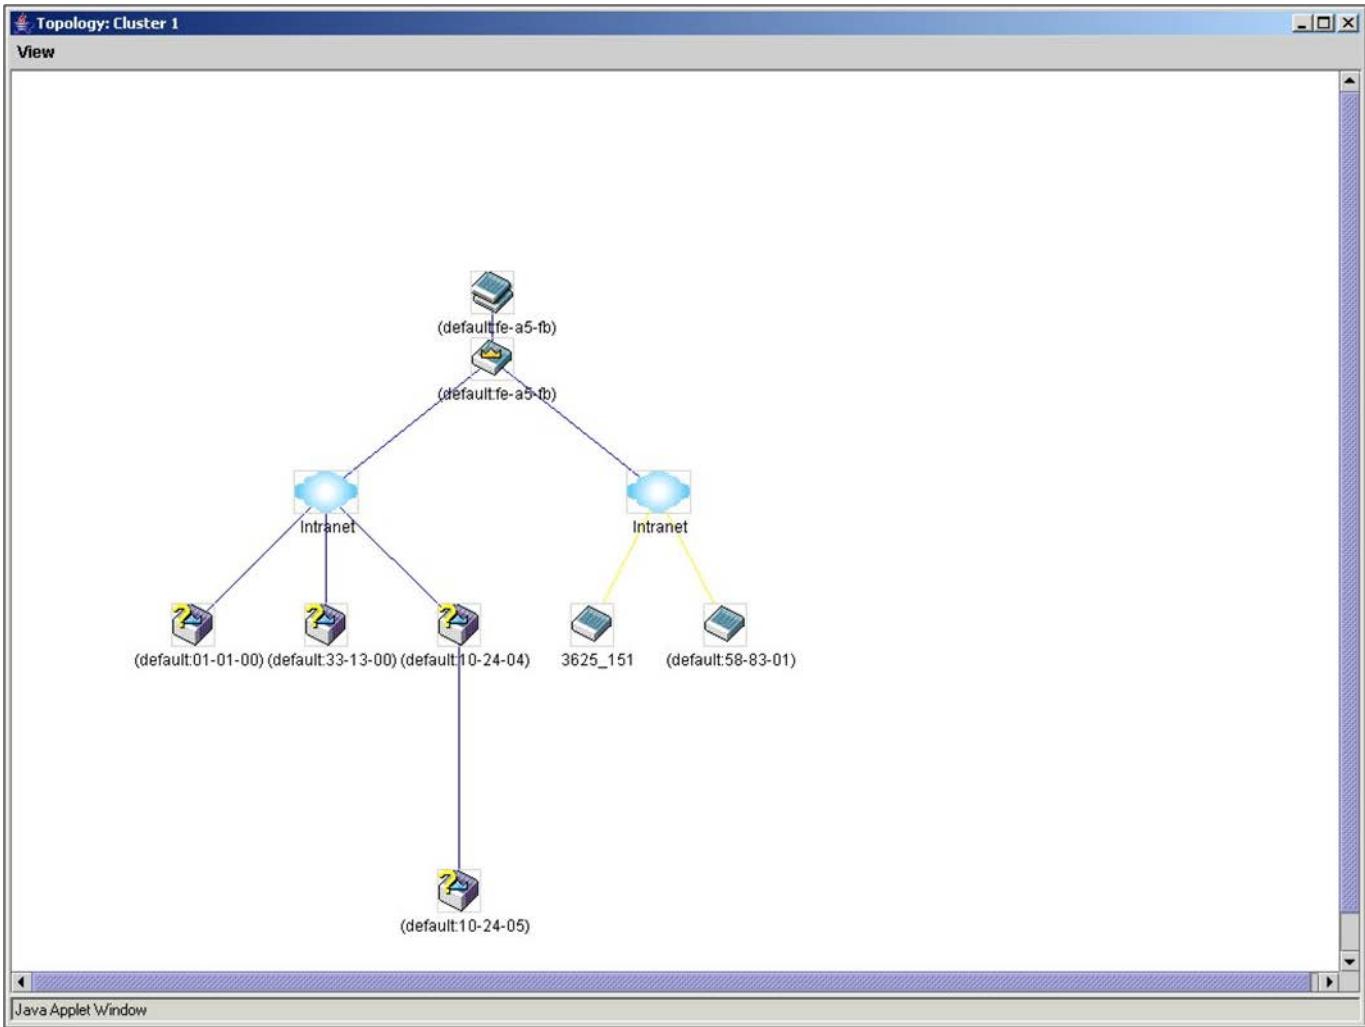

Figure 3-20 Single IP Management window - Tree View

The Topology window holds the following information on the **Data** tab:

Parameter	Description
<b>Device Name</b>	This field will display the Device Name of the switches in the SIM group configured by the user. If no device is configured by the name, it will be given the name default and tagged with the last six digits of the MAC Address to identify it.
<b>Local Port</b>	Displays the number of the physical port on the MS or CaS to which the CS is connected. The CS will have no entry in this field.
<b>Speed</b>	Displays the connection speed between the CS and the MS or CaS.
<b>Remote Port</b>	Displays the number of the remote physical port by which the MS or CaS connect to CS. The CS will have no entry in this field.
<b>MAC Address</b>	Displays the MAC Address of the corresponding Switch.
<b>Model Name</b>	Displays the full Model Name of the corresponding Switch.

To view the Topology View window, open the **View** drop-down menu in the toolbar and then click **Topology**, which will open the following Topology Map. This window will refresh itself periodically (20 seconds by default).

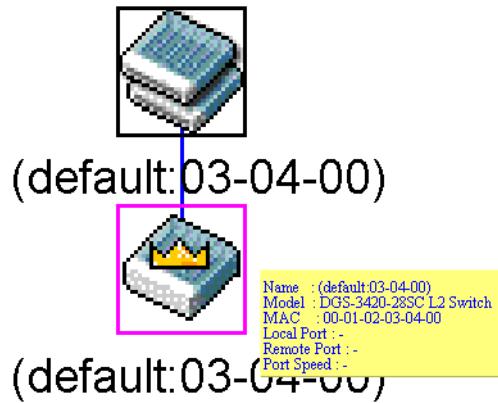

**Figure 3-21 Topology view**

This window will display how the devices within the Single IP Management Group connect to other groups and devices. Possible icons on this window are as follows:

Icon	Description	Icon	Description
	Group		Layer 3 member switch
	Layer 2 commander switch		Member switch of other group
	Layer 3 commander switch		Layer 2 candidate switch
	Commander switch of other group		Layer 3 candidate switch
	Layer 2 member switch.		Unknown device
	Non-SIM devices		

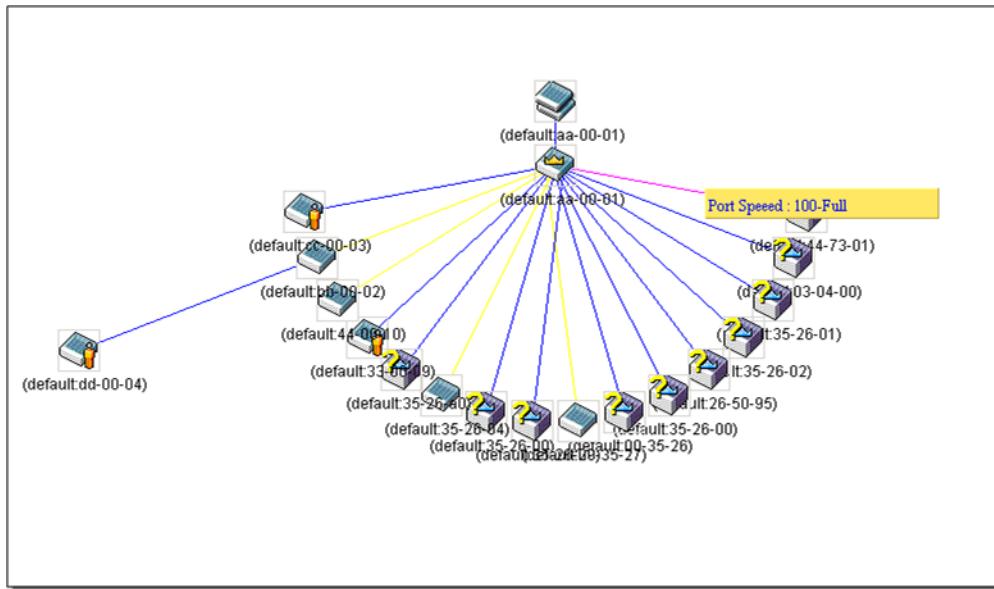

### Tool Tips

In the Topology view window, the mouse plays an important role in configuration and in viewing device information. Setting the mouse cursor over a specific device in the topology window (tool tip) will display the same information about a specific device as the Tree view does. See the window below for an example.

**Figure 3-22 Device Information Utilizing the Tool Tip**

Setting the mouse cursor over a line between two devices will display the connection speed between the two devices, as shown below.

**Figure 3-23 Port Speed Utilizing the Tool Tip**

### Right-Click

Right-clicking on a device will allow the user to perform various functions, depending on the role of the Switch in the SIM group and the icon associated with it.

### Group Icon

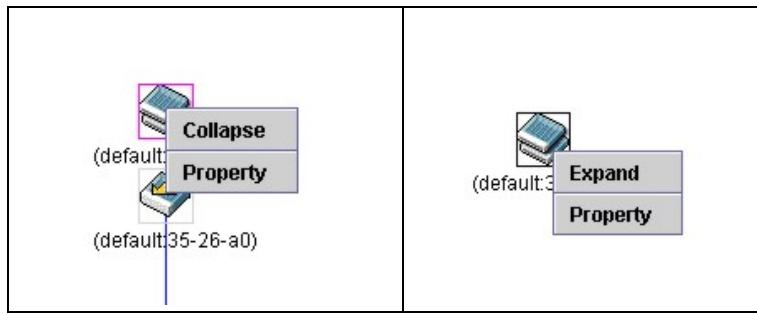

Figure 3-24 Right-Clicking a Group Icon

The following options may appear for the user to configure:

- **Collapse** – To collapse the group that will be represented by a single icon.
- **Expand** – To expand the SIM group, in detail.
- **Property** – To pop up a window to display the group information.

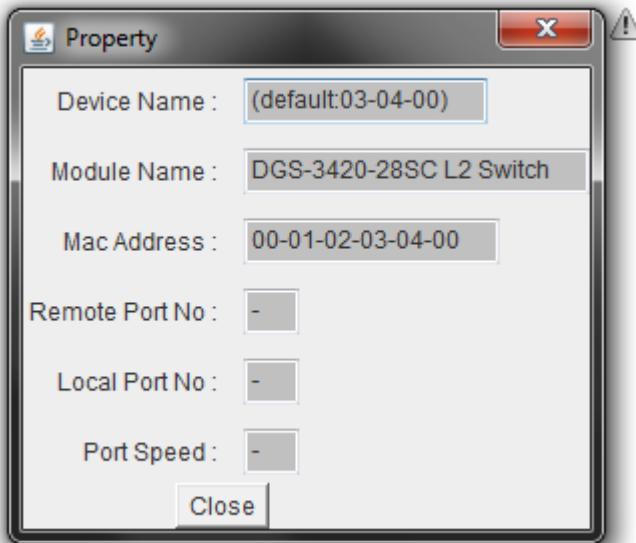

Figure 3-25 Property window

Parameter	Description
<b>Device Name</b>	This field will display the Device Name of the switches in the SIM group configured by the user. If no Device Name is configured by the name, it will be given the name default and tagged with the last six digits of the MAC Address to identify it.
<b>Module Name</b>	Displays the full module name of the switch that was right-clicked.
<b>MAC Address</b>	Displays the MAC Address of the corresponding Switch.
<b>Remote Port No</b>	Displays the number of the remote physical port by which the MS or CaS connect to CS. The CS will have no entry in this field.
<b>Local Port No</b>	Displays the number of the physical port on the MS or CaS that the CS is connected to. The CS will have no entry in this field.
<b>Port Speed</b>	Displays the connection speed between the CS and the MS or CaS

Click the **Close** button to close the property window.

### Commander Switch Icon

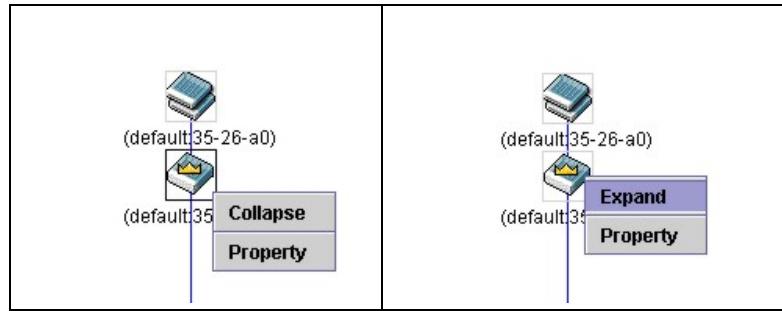

Figure 3-26 Right-clicking a Commander Icon

The following options may appear for the user to configure:

- **Collapse** – To collapse the group that will be represented by a single icon.
- **Expand** – To expand the SIM group, in detail.
- **Property** – To pop up a window to display the group information.

#### Member Switch Icon

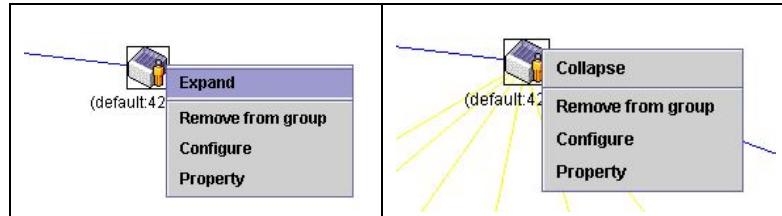

Figure 3-27 Right-clicking a Member icon

The following options may appear for the user to configure:

- **Collapse** – To collapse the group that will be represented by a single icon.
- **Expand** – To expand the SIM group, in detail.
- **Remove from group** – Remove a member from a group.
- **Configure** – Launch the web management to configure the Switch.
- **Property** – To pop up a window to display the device information.

#### Candidate Switch Icon

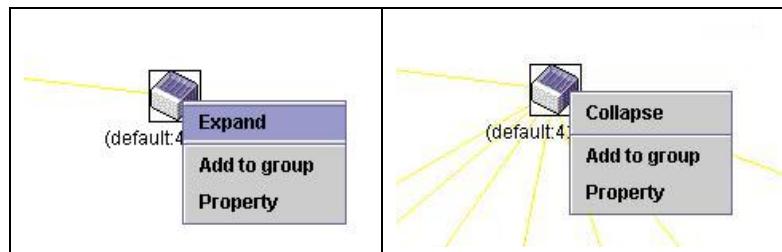

Figure 3-28 Right-clicking a Candidate icon

The following options may appear for the user to configure:

- **Collapse** – To collapse the group that will be represented by a single icon.
- **Expand** – To expand the SIM group, in detail.
- **Add to group** – Add a candidate to a group. Clicking this option will reveal the following dialog box for the user to enter a password for authentication from the Candidate Switch before being added to the SIM group. Click **OK** to enter the password or **Cancel** to exit the dialog box.

Figure 3-29 Input password window

- **Property** – To pop up a window to display the device information.

## Menu Bar

The **Single IP Management** window contains a menu bar for device configurations, as seen below.

Figure 3-30 Menu Bar of the Topology View

## File

- **Print Setup** – Will view the image to be printed.
- **Print Topology** – Will print the topology map.
- **Preference** – Will set display properties, such as polling interval, and the views to open at SIM startup.

## Group

- **Add to group** – Add a candidate to a group. Clicking this option will reveal the following dialog box for the user to enter a password for authentication from the Candidate Switch before being added to the SIM group. Click **OK** to enter the password or **Cancel** to exit the dialog box.

Figure 3-31 Input password window

- **Remove from Group** – Remove an MS from the group.

## Device

- **Configure** – Will open the Web manager for the specific device.

## View

- **Refresh** – Update the views with the latest status.
- **Topology** – Display the Topology view.

## Help

- **About** – Will display the SIM information, including the current SIM version.

Figure 3-32 About window

## Firmware Upgrade

This screen is used to upgrade firmware from the Commander Switch to the Member Switch. Member Switches will be listed in the table and will be specified by **Port** (port on the CS where the MS resides), **MAC Address**, **Model Name** and **Version**. To specify a certain Switch for firmware download, click its corresponding check box under the **Port** heading. To update the firmware, enter the **Server IP Address** where the firmware resides and enter the **Path/Filename** of the firmware. Click **Download** to initiate the file transfer.

To view the following window, click **Management > Single IP Management > Firmware Upgrade**, as show below:

Select All	ID	Port	MAC Address	Model Name	Firmware Version
------------	----	------	-------------	------------	------------------

Figure 3-33 Firmware Upgrade window

## Configuration File Backup/Restore

This screen is used to upgrade configuration files from the Commander Switch to the Member Switch using a TFTP server. Member Switches will be listed in the table and will be specified by **ID**, **Port** (port on the CS where the MS resides), **MAC Address**, **Model Name** and **Firmware Version**. To update the configuration file, enter the **Server IP Address** where the file resides and enter the **Path/Filename** of the configuration file. Click **Restore** to initiate the file transfer from a TFTP server to the Switch. Click **Backup** to backup the configuration file to a TFTP server.

To view the following window, click **Management > Single IP Management > Configuration File Backup/Restore**, as show below:

Select All	ID	Port	MAC Address	Model Name	Firmware Version
------------	----	------	-------------	------------	------------------

Figure 3-34 Configuration File Backup/Restore window

## Upload Log File

The following window is used to upload log files from SIM member switches to a specified PC. To upload a log file, enter the Server IP address of the SIM member switch and then enter a Path\Filename on your PC where you wish to save this file. Click **Upload** to initiate the file transfer.

To view the following window, click **Management > Single IP Management > Upload Log File**, as show below:

Select All	ID	Port	MAC Address	Model Name	Firmware Version
------------	----	------	-------------	------------	------------------

Figure 3-35 Upload Log File window

## SNMP Settings

Simple Network Management Protocol (SNMP) is an OSI Layer 7 (Application Layer) designed specifically for managing and monitoring network devices. SNMP enables network management stations to read and modify the settings of gateways, routers, switches, and other network devices. Use SNMP to configure system features for proper operation, monitor performance and detect potential problems in the Switch, switch group or network.

Managed devices that support SNMP include software (referred to as an agent), which runs locally on the device. A defined set of variables (managed objects) is maintained by the SNMP agent and used to manage the device. These objects are defined in a Management Information Base (MIB), which provides a standard presentation of the information controlled by the on-board SNMP agent. SNMP defines both the format of the MIB specifications and the protocol used to access this information over the network.

The Switch supports the SNMP versions 1, 2c, and 3. The three versions of SNMP vary in the level of security provided between the management station and the network device.

In SNMP v.1 and v.2, user authentication is accomplished using ‘community strings’, which function like passwords. The remote user SNMP application and the Switch SNMP must use the same community string. SNMP packets from any station that has not been authenticated are ignored (dropped).

The default community strings for the Switch used for SNMP v.1 and v.2 management access are:

- **public** – Allows authorized management stations to retrieve MIB objects.
- **private** – Allows authorized management stations to retrieve and modify MIB objects.

SNMPv3 uses a more sophisticated authentication process that is separated into two parts. The first part is to maintain a list of users and their attributes that are allowed to act as SNMP managers. The second part describes what each user on that list can do as an SNMP manager.

The Switch allows groups of users to be listed and configured with a shared set of privileges. The SNMP version may also be set for a listed group of SNMP managers. Thus, you may create a group of SNMP managers that are allowed to view read-only information or receive traps using SNMPv1 while assigning a higher level of security to another group, granting read/write privileges using SNMPv3.

Using SNMPv3 individual users or groups of SNMP managers can be allowed to perform or be restricted from performing specific SNMP management functions. The functions allowed or restricted are defined using the Object

Identifier (OID) associated with a specific MIB. An additional layer of security is available for SNMPv3 in that SNMP messages may be encrypted. To read more about how to configure SNMPv3 settings for the Switch read the next section.

### **Traps**

Traps are messages that alert network personnel of events that occur on the Switch. The events can be as serious as a reboot (someone accidentally turned OFF the Switch), or less serious like a port status change. The Switch generates traps and sends them to the trap recipient (or network manager). Typical traps include trap messages for Authentication Failure, Topology Change and Broadcast\Multicast Storm.

### **MIBs**

The Switch in the Management Information Base (MIB) stores management and counter information. The Switch uses the standard MIB-II Management Information Base module. Consequently, values for MIB objects can be retrieved from any SNMP-based network management software. In addition to the standard MIB-II, the Switch also supports its own proprietary enterprise MIB as an extended Management Information Base. Specifying the MIB Object Identifier may also retrieve the proprietary MIB. MIB values can be either read-only or read-write.

The Switch incorporates a flexible SNMP management for the switching environment. SNMP management can be customized to suit the needs of the networks and the preferences of the network administrator. Use the SNMP V3 menus to select the SNMP version used for specific tasks.

The Switch supports the Simple Network Management Protocol (SNMP) versions 1, 2c, and 3. The administrator can specify the SNMP version used to monitor and control the Switch. The three versions of SNMP vary in the level of security provided between the management station and the network device.

SNMP settings are configured using the menus located on the SNMP V3 folder of the Web manager. Workstations on the network that are allowed SNMP privileged access to the Switch can be restricted with the Management Station IP Address menu.

## **SNMP Global Settings**

SNMP global state settings can be enabled or disabled.

To view the following window, click **Management > SNMP Settings > SNMP Global Settings**, as show below:

**Figure 3-36 SNMP Global Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>SNMP State</b>	Select to enable or disable SNMP feature.
<b>SNMP Response Broadcast Request</b>	Select to enable or disable the SNMP response broadcast request option.

Click the **Apply** button to accept the changes made.

## SNMP Traps Settings

Users can enable and disable the SNMP trap support function of the switch and SNMP authentication failure trap support, respectively.

To view the following window, click **Management > SNMP Settings > SNMP Traps Settings**, as show below:

SNMP Traps Settings	
SNMP Traps	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
Authenticate Traps	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
Linkchange Traps	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
Coldstart Traps	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
Warmstart Traps	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled

**Apply**

Figure 3-37 SNMP Traps Settings window

The fields that can be configured are described below:

Parameter	Description
<b>SNMP Traps</b>	Enable this option to use the SNMP Traps feature.
<b>Authentication Traps</b>	Enable this option to use the SNMP Authentication Traps feature.
<b>Linkchange Traps</b>	Enable this option to use the SNMP Link Change Traps feature.
<b>Coldstart Traps</b>	Enable this option to use the SNMP Cold Start Traps feature.
<b>Warmstart Traps</b>	Enable this option to use the SNMP Warm Start Traps feature.

Click the **Apply** button to accept the changes made.

## SNMP Linkchange Traps Settings

On this page the user can configure the SNMP link change trap settings.

To view the following window, click **Management > SNMP Settings > SNMP Linkchange Traps Settings**, as show below:

The screenshot shows the 'SNMP Linkchange Traps Settings' window. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), 'To Port' (set to 01), and 'State' (set to Enabled). A large 'Apply' button is located at the top right. Below this, a message says 'Linkchange Traps: Enabled'. The main area is titled 'Unit 1 Settings' and contains a table with 23 rows, each representing a port from 1 to 23. All ports are listed as 'Enabled'.

Port	State
1	Enabled
2	Enabled
3	Enabled
4	Enabled
5	Enabled
6	Enabled
7	Enabled
8	Enabled
9	Enabled
10	Enabled
11	Enabled
12	Enabled
13	Enabled
14	Enabled
15	Enabled
16	Enabled
17	Enabled
18	Enabled
19	Enabled
20	Enabled
21	Enabled
22	Enabled
23	Enabled

Figure 3-38 SNMP Linkchange Traps Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the starting and ending ports to use.
<b>State</b>	Use the drop-down menu to enable or disable the SNMP link change Trap.

Click the **Apply** button to accept the changes made.

## SNMP View Table Settings

Users can assign views to community strings that define which MIB objects can be accessed by a remote SNMP manager. The SNMP Group created with this table maps SNMP users (identified in the SNMP User Table) to the views created in the previous window.

To view the following window, click **Management > SNMP Settings > SNMP View Table Settings**, as show below:

The screenshot shows the 'SNMP View Table Settings' window. At the top, there are input fields for 'View Name' (a text input box), 'Subtree OID' (another text input box), and 'View Type' (a dropdown menu set to 'Included'). To the right of these is an 'Apply' button. Below this is a table titled 'Total Entries: 8' with columns 'View Name', 'Subtree', 'View Type', and 'Delete' buttons. The table lists eight entries:

View Name	Subtree	View Type	
restricted	1.3.6.1.2.1.1	Included	Delete
restricted	1.3.6.1.2.1.11	Included	Delete
restricted	1.3.6.1.6.3.10.2.1	Included	Delete
restricted	1.3.6.1.6.3.11.2.1	Included	Delete
restricted	1.3.6.1.6.3.15.1.1	Included	Delete
CommunityView	1	Included	Delete
CommunityView	1.3.6.1.6.3	Excluded	Delete
CommunityView	1.3.6.1.6.3.1	Included	Delete

Figure 3-39 SNMP View Table Settings window

The fields that can be configured are described below:

Parameter	Description
<b>View Name</b>	Type an alphanumeric string of up to 32 characters. This is used to identify the new SNMP view being created.
<b>Subtree OID</b>	Type the Object Identifier (OID) Subtree for the view. The OID identifies an object tree (MIB tree) that will be included or excluded from access by an SNMP manager.
<b>View Type</b>	Select Included to include this object in the list of objects that an SNMP manager can access. Select Excluded to exclude this object from the list of objects that an SNMP manager can access.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry.

## SNMP Community Table Settings

Users can create an SNMP community string to define the relationship between the SNMP manager and an agent. The community string acts like a password to permit access to the agent on the Switch. One or more of the following characteristics can be associated with the community string:

- An Access List of IP addresses of SNMP managers that are permitted to use the community string to gain access to the Switch's SNMP agent.
- Any MIB view that defines the subset of all MIB objects will be accessible to the SNMP community.
- Read/write or read-only level permission for the MIB objects accessible to the SNMP community.

To view the following window, click **Management > SNMP Settings > SNMP Community Table Settings**, as shown below:

The screenshot shows the 'SNMP Community Table Settings' window. At the top, there's a section for 'Add Community' with fields for 'Community Name' (a text input box), 'View Name' (a text input box), and 'Access Right' (a dropdown menu set to 'Read Only'). To the right of these fields is an 'Apply' button. Below this, a message says 'Total Entries: 2'. A table lists two entries:

Community Name	View Name	Access Right	
private	CommunityView	read_write	<b>Delete</b>
public	CommunityView	read_only	<b>Delete</b>

Figure 3-40 SNMP community Table Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Community Name</b>	Type an alphanumeric string of up to 32 characters that is used to identify members of an SNMP community. This string is used like a password to give remote SNMP managers access to MIB objects in the Switch's SNMP agent.
<b>View Name</b>	Type an alphanumeric string of up to 32 characters that is used to identify the group of MIB objects that a remote SNMP manager is allowed to access on the Switch. The view name must exist in the SNMP View Table.
<b>Access Right</b>	<p><i>Read Only</i> – Specify that SNMP community members using the community string created can only read the contents of the MIBs on the Switch.</p> <p><i>Read Write</i> – Specify that SNMP community members using the community string created can read from, and write to the contents of the MIBs on the Switch.</p>

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry.

## SNMP Group Table Settings

An SNMP Group created with this table maps SNMP users (identified in the SNMP User Table) to the views created in the previous window.

To view the following window, click **Management > SNMP Settings > SNMP Group Table Settings**, as show below:

**SNMP Group Table Settings**

Safeguard

**Add Group**

Group Name	<input type="text"/>
Read View Name	<input type="text"/>
Write View Name	<input type="text"/>
Notify View Name	<input type="text"/>
User-based Security Model	SNMPv1
Security Level	NoAuthNoPriv

**Total Entries: 5**

Group Name	Read View Name	Write View Name	Notify View Name	User-based Security Model	Security Level	
public	CommunityV...		CommunityV...	SNMPv1	NoAuthNoPriv	<input type="button" value="Delete"/>
public	CommunityV...		CommunityV...	SNMPv2	NoAuthNoPriv	<input type="button" value="Delete"/>
initial	restricted		restricted	SNMPv3	NoAuthNoPriv	<input type="button" value="Delete"/>
private	CommunityV...	CommunityV...	CommunityV...	SNMPv1	NoAuthNoPriv	<input type="button" value="Delete"/>
private	CommunityV...	CommunityV...	CommunityV...	SNMPv2	NoAuthNoPriv	<input type="button" value="Delete"/>

Figure 3-41 SNMP Group Table Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Group Name</b>	Type an alphanumeric string of up to 32 characters. This is used to identify the new SNMP group of SNMP users.
<b>Read View Name</b>	This name is used to specify the SNMP group created can request SNMP messages.
<b>Write View Name</b>	Specify a SNMP group name for users that are allowed SNMP write privileges to the Switch's SNMP agent.
<b>Notify View Name</b>	Specify a SNMP group name for users that can receive SNMP trap messages generated by the Switch's SNMP agent.
<b>User-based Security Model</b>	SNMPv1 – Specify that SNMP version 1 will be used. SNMPv2 – Specify that SNMP version 2c will be used. The SNMPv2 supports both centralized and distributed network management strategies. It includes improvements in the Structure of Management Information (SMI) and adds some security features. SNMPv3 – Specify that the SNMP version 3 will be used. SNMPv3 provides secure access to devices through a combination of authentication and encrypting packets over the network.
<b>Security Level</b>	The Security Level settings only apply to SNMPv3. NoAuthNoPriv – Specify that there will be no authorization and no encryption of packets sent between the Switch and a remote SNMP manager. AuthNoPriv – Specify that authorization will be required, but there will be no encryption of packets sent between the Switch and a remote SNMP manager. AuthPriv – Specify that authorization will be required, and that packets sent between the Switch and a remote SNMP manager will be encrypted.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry.

## SNMP Engine ID Settings

The Engine ID is a unique identifier used for SNMP V3 implementations on the Switch.

To view the following window, click **Management > SNMP Settings > SNMP Engine ID Settings**, as show below:

**SNMP Engine ID Settings**

Engine ID: 800000ab03000102030400

Note: Engine ID length is 10-64. The accepted characters are from 0 to F.

Apply

Figure 3-42 SNMP Engine ID Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Engine ID</b>	To change the Engine ID, type the new Engine ID value in the space provided. The SNMP engine ID displays the identification of the SNMP engine on the Switch. The default value is suggested in RFC2271. The very first bit is 1, and the first four octets are set to the binary equivalent of the agent's SNMP management private enterprise number as assigned by IANA (D-Link is 171). The fifth octet is 03 to indicate the rest is the MAC address of this device. The sixth to eleventh octets is the MAC address.

Click the **Apply** button to accept the changes made.

**NOTE:** The Engine ID length is 10-64 and accepted characters can range from 0 to F.

## SNMP User Table Settings

This window displays all of the SNMP User's currently configured on the Switch.

To view the following window, click **Management > SNMP Settings > SNMP User Table Settings**, as show below:

**SNMP User Table Settings**

Add User

User Name	initial	Group Name	initial
SNMP Version	V3	SNMP V3 Encryption	None
Auth-Protocol by Password	MD5	Password	(empty)
Priv-Protocol by Password	None	Password	(empty)
Auth-Protocol by Key	MD5	Key	(empty)
Priv-Protocol by Key	None	Key	(empty)

Apply

Total Entries: 1

User Name	Group Name	SNMP Version	Auth-Protocol	Priv-Protocol
initial	initial	V3	None	None

Delete

Figure 3-43 SNMP User Table Settings window

The fields that can be configured are described below:

Parameter	Description
<b>User Name</b>	An alphanumeric string of up to 32 characters. This is used to identify the SNMP users.

<b>Group Name</b>	This name is used to specify the SNMP group created can request SNMP messages.
<b>SNMP Version</b>	V3 – Indicates that SNMP version 3 is in use.
<b>SNMP V3 Encryption</b>	Use the drop-down menu to enable encryption for SNMP V3. This is only operable in SNMP V3 mode. The choices are <i>None</i> , <i>Password</i> , or <i>Key</i> .
<b>Auth-Protocol</b>	<i>MD5</i> – Specify that the HMAC-MD5-96 authentication level will be used. This field is only operable when V3 is selected in the SNMP Version field and the Encryption field has been checked. This field will require the user to enter a password. <i>SHA</i> – Specify that the HMAC-SHA authentication protocol will be used. This field is only operable when V3 is selected in the SNMP Version field and the Encryption field has been checked. This field will require the user to enter a password.
<b>Priv-Protocol</b>	<i>None</i> – Specify that no authorization protocol is in use. <i>DES</i> – Specify that DES 56-bit encryption is in use, based on the CBC-DES (DES-56) standard. This field is only operable when V3 is selected in the SNMP Version field and the Encryption field has been checked. This field will require the user to enter a password.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry.

## SNMP Host Table Settings

Users can set up SNMP trap recipients for IPv4.

To view the following window, click **Management > SNMP Settings > SNMP Host Table Settings**, as show below:

Figure 3-44 SNMP Host Table Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Host IP Address</b>	Type the IP address of the remote management station that will serve as the SNMP host for the Switch.
<b>User-based Security Model</b>	<i>SNMPv1</i> – Specify that SNMP version 1 will be used. <i>SNMPv2</i> – Specify that SNMP version 2 will be used. <i>SNMPv3</i> – Specify that SNMP version 3 will be used.
<b>Security Level</b>	<i>NoAuthNoPriv</i> – To specify that the SNMP version 3 will be used, with a NoAuth-NoPriv security level. <i>AuthNoPriv</i> – To specify that the SNMP version 3 will be used, with an Auth-NoPriv security level.

	<i>AuthPriv</i> – To specify that the SNMP version 3 will be used, with an Auth-Priv security level.
<b>Community String / SNMPv3 User Name</b>	Type in the community string or SNMP V3 user name as appropriate.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry.

## SNMP v6Host Table Settings

Users can set up SNMP trap recipients for IPv6.

To view the following window, click **Management > SNMP Settings > SNMP v6Host Table Settings**, as show below:

SNMP v6Host Table Settings	
<b>Add Host Table</b> Host IPv6 Address: <input type="text"/> User-based Security Model: <input type="button" value="SNMPv1"/> Security Level: <input type="button" value="NoAuthNoPriv"/> Community String / SNMPv3 User Name: <input type="text"/>	
<input type="button" value="Apply"/>	
<b>Total Entries: 0</b> <input type="button" value="Host IPv6 Address"/> <input type="button" value="User-based Security Model"/> <input type="button" value="Security Level"/> <input type="button" value="Community Name/SNMPv3 User Name"/>	

**3-45 SNMPv6 Host Table Settings**

The fields that can be configured are described below:

Parameter	Description
<b>Host IPv6 Address</b>	Type the IPv6 address of the remote management station that will serve as the SNMP host for the Switch.
<b>User-based Security Model</b>	<i>SNMPv1</i> – Specifies that SNMP version 1 will be used. <i>SNMPv2</i> – Specifies that SNMP version 2 will be used. <i>SNMPv3</i> – Specifies that SNMP version 3 will be used.
<b>Security Level</b>	<i>NoAuthNoPriv</i> – To specify that the SNMP version 3 will be used, with a NoAuth-NoPriv security level. <i>AuthNoPriv</i> – To specify that the SNMP version 3 will be used, with an Auth-NoPriv security level. <i>AuthPriv</i> – To specify that the SNMP version 3 will be used, with an Auth-Priv security level.
<b>Community String / SNMPv3 User Name</b>	Type in the community string or SNMP V3 user name as appropriate.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry.

## RMON Settings

This window is used to enable or disable remote monitoring (RMON) for the rising and falling alarm trap feature for the SNMP function on the Switch.

To view the following window, click **Management > SNMP Settings > RMON Settings**, as show below:

The window has a title bar "RMON Settings" and a "Safeguard" icon. It contains two rows of settings. The first row is "RMON Rising Alarm Trap" with radio buttons for "Enabled" (selected) and "Disabled". The second row is "RMON Falling Alarm Trap" with radio buttons for "Enabled" (selected) and "Disabled". At the bottom right is a grey "Apply" button.

Figure 3-46 RMON Settings window

The fields that can be configured are described below:

Parameter	Description
<b>RMON Rising Alarm Trap</b>	Enable this option to use the RMON Rising Alarm Trap Feature.
<b>RMON Falling Alarm Trap</b>	Enable this option to use the RMON Falling Alarm Trap Feature.

Click the **Apply** button to accept the changes made.

## SNMP Community Encryption Settings

This window is used to enable or disable the encryption state on the SNMP community string.

To view the following window, click **Management > SNMP Settings > SNMP Community Encryption Settings**, as show below:

The window has a title bar "SNMP Community Encryption Settings" and a "Safeguard" icon. It contains one row of settings. The row is "SNMP Community Encryption State" with radio buttons for "Enabled" and "Disabled" (selected). At the bottom right is a grey "Apply" button.

Figure 3-47 SNMP Community Encryption Settings window

The fields that can be configured are described below:

Parameter	Description
<b>SNMP Community Encryption State</b>	Click the Enabled or Disabled radio button to enable or disable the encryption.

Click the **Apply** button to accept the changes made.

## SNMP Community Masking Settings

This window is used to choose a security method for creating an SNMP community string, but the community string encrypted or not depends on the SNMP community encryption state.

To view the following window, click **Management > SNMP Settings > SNMP Community Masking Settings**, as show below:

The screenshot shows the 'SNMP Community Masking Settings' window. It contains four configuration fields: 'View Name' set to 'restricted', 'Access Right' set to 'Read Only', 'Enter a case-sensitive community' (empty), and 'Enter the community again for confirmation' (empty). A 'Apply' button is located in the bottom right corner.

Figure 3-48 SNMP community Masking Settings window

The fields that can be configured are described below:

Parameter	Description
<b>View Name</b>	Use the drop-down menu to choose the MIB view name.
<b>Access right</b>	Use the drop-down menu to select the access right for the user using the community string. Available options are <i>Read Only</i> and <i>Read Write</i> .
<b>Enter a case-sensitive community</b>	Enter a case-sensitive community string.
<b>Enter the community again for confirmation</b>	Retype the community string for confirmation.

Click the **Apply** button to accept the changes made.

## Telnet Settings

Users can configure Telnet Settings on the Switch.

To view the following window, click **Management > Telnet Settings**, as show below:

The screenshot shows the 'Telnet Settings' window. It includes sections for 'Telnet Settings' (with 'Enabled' selected for state and port 23) and 'Telnet Source IP Settings' (with fields for Interface Name, IPv4 Address, and IPv6 Address, plus 'Apply' and 'Clear IP Address' buttons).

Figure 3-49 Telnet Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Telnet State</b>	Telnet configuration is Enabled by default. If you do not want to allow configuration of the system through Telnet choose Disabled.
<b>Port (1-65535)</b>	The TCP port number used for Telnet management of the Switch. The “well-known” TCP port for the Telnet protocol is 23.
<b>Interface Name</b>	Enter the TELNET source IP interface name used here.
<b>IPv4 Address</b>	Enter the TELNET source IPv4 address used here.

<b>IPv6 Address</b>	Enter the TELNET source IPv6 address used here.
---------------------	---

Click the **Apply** button to accept the changes made.

Click the **Clear IP Address** button to clear the IP addresses entered.

## Web Settings

Users can configure the Web settings on the Switch.

To view the following window, click **Management > Web Settings**, as show below:

The screenshot shows the 'Web Settings' configuration window. It has a title bar 'Web Settings' and a 'Safeguard' icon. Below the title bar, there are two radio buttons: 'Enabled' (selected) and 'Disabled'. Underneath these is a 'Port (1-65535)' field containing the value '80'. At the bottom right is a blue 'Apply' button.

Figure 3-50 Web Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Web Status</b>	Web-based management is Enabled by default. If you choose to disable this by clicking Disabled, you will lose the ability to configure the system through the web interface as soon as these settings are applied.
<b>Port (1-65535)</b>	The TCP port number used for web-based management of the Switch. The “well-known” TCP port for the Web protocol is 80.

Click the **Apply** button to accept the changes made.

## Power Saving

Power Saving is one part of D-Link Green Technologies. To learn more about the D-Link Green Technologies, go to <http://green.dlink.com/> for more details.

## LED State Settings

This window is used to configure the port LED state.

To view the following window, click **Management > Power Saving > LED State Settings**, as show below:

The screenshot shows the 'LED State Settings' configuration window. It has a title bar 'LED State Settings' and a 'Safeguard' icon. Below the title bar, there is a radio button group for 'LED State' with 'Enabled' selected. At the bottom right is a blue 'Apply' button.

Figure 3-51 LED State Settings window

The fields that can be configured are described below:

Parameter	Description
-----------	-------------

<b>LED State</b>	Click the radio buttons to enable or disable the port LED state.
------------------	--

Click the **Apply** button to accept the changes made.

## Power Saving Settings

This window allows the user to implement the Switch's built-in power saving features and set the schedule to enforce the settings.

To view the following window, click **Management > Power Saving > Power Saving Settings**, as show below:

The screenshot shows the 'Power Saving Settings' window. At the top, there are five sections for 'Power Saving Global Settings' with radio buttons for 'Enabled' or 'Disabled' states. Below this is a section for 'Power Saving Configuration on System Hibernation' with a dropdown for 'Action' (Add Time Range), a text input for 'Time Range Name' (Max: 32 characters), and buttons for 'Apply' and 'Clear Time Range'. At the bottom, there is a table with columns 'NO.' and 'Time Range'.

Figure 3-52 Power Saving Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Power Saving Mode Link Detection State</b>	Click the radio buttons to enable or disable the link detection state. When enabled, a port which has a link down status will be turned off to save power to the Switch. This will not affect the port's capabilities when the port status is link up.
<b>Power Saving Mode Length Detection State</b>	Click the radio buttons to enable or disable length detection state. When enabled, the Switch will automatically determine the length of the cable and adjust the power flow accordingly.
<b>Power Saving Mode LED State</b>	Click the radio buttons to enable or disable LED state. When enabled, the LED's state of ports will be turned off during the configured time range.
<b>Power Saving Mode Port State</b>	Click the radio buttons to enable or disable port state. When enabled, the ports will be shut down during the configured time range.
<b>Power Saving Mode Hibernation State</b>	Click the radio buttons to enable or disable hibernation state. When enabled, the Switch will go into a low power state and be idle during the configured time range. It will shut down all the ports, all network function (telnet, ping, etc.) will not work, and only the console connection will work via the RS232 port. If the Switch is an endpoint type PSE (Power Sourcing Equipment), it will not provide power to the port.
<b>Action</b>	Use the drop down menu to add or delete the schedule.
<b>Time Range Name</b>	Specify the name of the schedule.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Clear Time Range** to remove all the entries.

## Power Saving LED Settings

This window is used to add or delete the power saving schedule on the LED of all ports.

To view the following window, click **Management > Power Saving > Power Saving LED Settings**, as show below:

NO.	Time Range

**Figure 3-53 Power Saving LED Settings window**

The fields that can be configured are described below:

Parameter	Description
Action	Use the drop down menu to add or delete the schedule.
Time Range Name	Specify the name of the schedule.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Clear Time Range** to remove all the entries.

## Power Saving Port Settings

This window is used to set the power saving state.

To view the following window, click **Management > Power Saving > Power Saving Port Settings**, as show below:

Port	Time Range Name

**Figure 3-54 Power Saving Port Settings**

The fields that can be configured are described below:

Parameter	Description
Unit	Select the unit you wish to configure.
From Port / To Port	Select the appropriate port range used for the configuration.
Action	Use the drop down menu to add or delete the schedule.
Time Range Name	Specify the name of the schedule.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Clear Time Range** to remove all the entries.

To learn more about the D-Link Green Technologies, go to <http://green.dlink.com/> for more details.

### Understanding IEEE 802.1p Priority

Priority tagging is a function defined by the IEEE 802.1p standard designed to provide a means of managing traffic on a network where many different types of data may be transmitted simultaneously. It is intended to alleviate problems associated with the delivery of time critical data over congested networks. The quality of applications that are dependent on such time critical data, such as video conferencing, can be severely and adversely affected by even very small delays in transmission.

Network devices that are in compliance with the IEEE 802.1p standard have the ability to recognize the priority level of data packets. These devices can also assign a priority label or tag to packets. Compliant devices can also strip priority tags from packets. This priority tag determines the packet's degree of expeditiousness and determines the queue to which it will be assigned.

Priority tags are given values from 0 to 7 with 0 being assigned to the lowest priority data and 7 assigned to the highest. The highest priority tag 7 is generally only used for data associated with video or audio applications, which are sensitive to even slight delays, or for data from specified end users whose data transmissions warrant special consideration.

The Switch allows you to further tailor how priority tagged data packets are handled on your network. Using queues to manage priority tagged data allows you to specify its relative priority to suit the needs of your network. There may be circumstances where it would be advantageous to group two or more differently tagged packets into the same queue. Generally, however, it is recommended that the highest priority queue, Queue 7, be reserved for data packets with a priority value of 7. Packets that have not been given any priority value are placed in Queue 0 and thus given the lowest priority for delivery.

Strict mode and weighted round robin system are employed on the Switch to determine the rate at which the queues are emptied of packets. The ratio used for clearing the queues is 4:1. This means that the highest priority queue, Queue 7, will clear 4 packets for every 1 packet cleared from Queue 0.

Remember, the priority queue settings on the Switch are for all ports, and all devices connected to the Switch will be affected. This priority queuing system will be especially beneficial if your network employs switches with the capability of assigning priority tags.

## **VLAN Description**

A Virtual Local Area Network (VLAN) is a network topology configured according to a logical scheme rather than the physical layout. VLANs can be used to combine any collection of LAN segments into an autonomous user group that appears as a single LAN. VLANs also logically segment the network into different broadcast domains so that packets are forwarded only between ports within the VLAN. Typically, a VLAN corresponds to a particular subnet, although not necessarily.

VLANs can enhance performance by conserving bandwidth, and improve security by limiting traffic to specific domains.

A VLAN is a collection of end nodes grouped by logic instead of physical location. End nodes that frequently communicate with each other are assigned to the same VLAN, regardless of where they are physically on the network. Logically, a VLAN can be equated to a broadcast domain, because broadcast packets are forwarded to only members of the VLAN on which the broadcast was initiated.

## **Notes about VLANs on the Switch**

- No matter what basis is used to uniquely identify end nodes and assign these nodes VLAN membership, packets cannot cross VLANs without a network device performing a routing function between the VLANs.
- The Switch supports IEEE 802.1Q VLANs. The port untagging function can be used to remove the 802.1Q tag from packet headers to maintain compatibility with devices that are tag-unaware.
- The Switch's default is to assign all ports to a single 802.1Q VLAN named "default."
- The "default" VLAN has a VID = 1.
- The member ports of Port-based VLANs may overlap, if desired.

## **IEEE 802.1Q VLANs**

Some relevant terms:

- **Tagging** – The act of putting 802.1Q VLAN information into the header of a packet.
- **Untagging** – The act of stripping 802.1Q VLAN information out of the packet header.
- **Ingress port** – A port on a switch where packets are flowing into the Switch and VLAN decisions must be made.
- **Egress port** – A port on a switch where packets are flowing out of the Switch, either to another switch or to an end station, and tagging decisions must be made.

IEEE 802.1Q (tagged) VLANs are implemented on the Switch. 802.1Q VLANs require tagging, which enables them to span the entire network (assuming all switches on the network are IEEE 802.1Q-compliant).

VLANs allow a network to be segmented in order to reduce the size of broadcast domains. All packets entering a VLAN will only be forwarded to the stations (over IEEE 802.1Q enabled switches) that are members of that VLAN, and this includes broadcast, multicast and unicast packets from unknown sources.

VLANs can also provide a level of security to your network. IEEE 802.1Q VLANs will only deliver packets between stations that are members of the VLAN.

Any port can be configured as either tagging or untagging. The untagging feature of IEEE 802.1Q VLANs allows VLANs to work with legacy switches that don't recognize VLAN tags in packet headers. The tagging feature allows VLANs to span multiple 802.1Q-compliant switches through a single physical connection and allows Spanning Tree to be enabled on all ports and work normally.

The IEEE 802.1Q standard restricts the forwarding of untagged packets to the VLAN the receiving port is a member of.

The main characteristics of IEEE 802.1Q are as follows:

- Assigns packets to VLANs by filtering.
- Assumes the presence of a single global spanning tree.
- Uses an explicit tagging scheme with one-level tagging.
- 802.1Q VLAN Packet Forwarding
- Packet forwarding decisions are made based upon the following three types of rules:
  - Ingress rules – rules relevant to the classification of received frames belonging to a VLAN.
  - Forwarding rules between ports – decides whether to filter or forward the packet.
  - Egress rules – determines if the packet must be sent tagged or untagged.

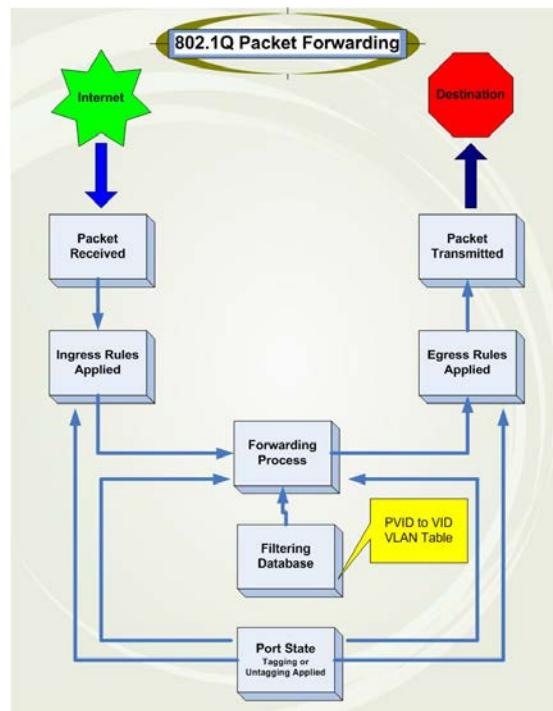

Figure 4-1 IEEE 802.1Q Packet Forwarding

## 802.1Q VLAN Tags

The figure below shows the 802.1Q VLAN tag. There are four additional octets inserted after the source MAC address. Their presence is indicated by a value of 0x8100 in the EtherType field. When a packet's EtherType field is equal to 0x8100, the packet carries the IEEE 802.1Q/802.1p tag. The tag is contained in the following two octets and consists of 3 bits of user priority, 1 bit of Canonical Format Identifier (CFI – used for encapsulating Token Ring packets so they can be carried across Ethernet backbones), and 12 bits of VLAN ID (VID). The 3 bits of user priority are used by 802.1p. The VID is the VLAN identifier and is used by the 802.1Q standard. Because the VID is 12 bits long, 4094 unique VLANs can be identified.

The tag is inserted into the packet header making the entire packet longer by 4 octets. All of the information originally contained in the packet is retained.

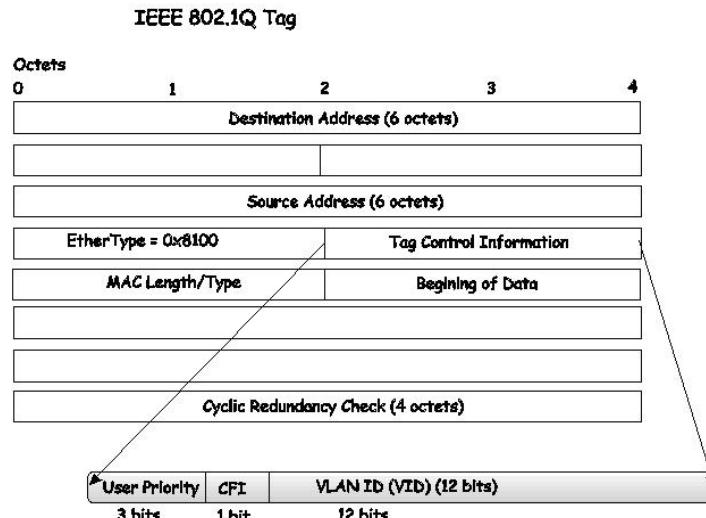

Figure 4-2 IEEE 802.1Q Tag

The EtherType and VLAN ID are inserted after the MAC source address, but before the original EtherType/Length or Logical Link Control. Because the packet is now a bit longer than it was originally, the Cyclic Redundancy Check (CRC) must be recalculated.

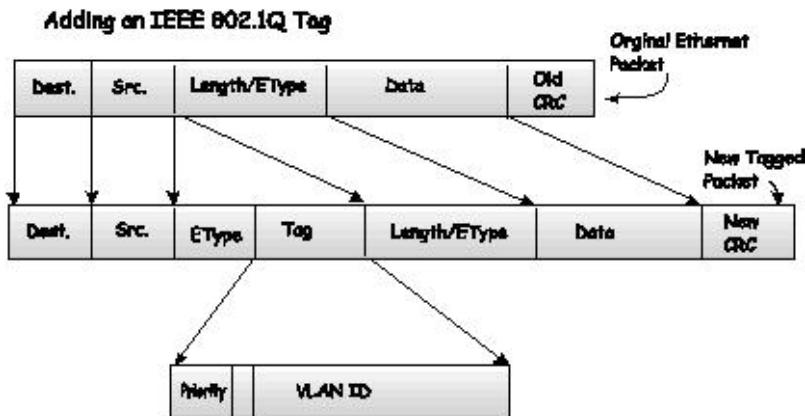

Figure 4-3 Adding an IEEE 802.1Q Tag

### Port VLAN ID

Packets that are tagged (are carrying the 802.1Q VID information) can be transmitted from one 802.1Q compliant network device to another with the VLAN information intact. This allows 802.1Q VLANs to span network devices (and indeed, the entire network, if all network devices are 802.1Q compliant).

Unfortunately, not all network devices are 802.1Q compliant. These devices are referred to as tag-unaware. 802.1Q devices are referred to as tag-aware.

Prior to the adoption of 802.1Q VLANs, port-based and MAC-based VLANs were in common use. These VLANs relied upon a Port VLAN ID (PVID) to forward packets. An untagged packet received on a given port would be assigned that port's PVID and then be forwarded to the port that corresponded to the packet's destination address (found in the Switch's forwarding table).

Within the Switch, different PVIDs mean different VLANs (remember that two VLANs cannot communicate without an external router). So, VLAN identification based upon the PVIDs cannot create VLANs that extend outside a given switch (or switch stack).

Every physical port on a switch has a PVID. 802.1Q ports are also assigned a PVID, for use within the Switch. If no VLANs are defined on the Switch, all ports are then assigned to a default VLAN with a PVID equal to 1. Untagged packets are assigned the PVID of the port on which they were received. Forwarding decisions are based upon this PVID, in so far as VLANs are concerned. Tagged packets are forwarded according to the VID contained within the tag.

Tag-aware switches must keep a table to relate PVIDs within the Switch to VIDs on the network. The Switch will compare the VID of a packet to be transmitted to the VID of the port that is to transmit the packet. If the two VIDs are different, the Switch will drop the packet. Because of the existence of the PVID for untagged packets and the VID for tagged packets, tag-aware and tag-unaware network devices can coexist on the same network.

A switch port can have only one PVID, but can have as many VIDs as the Switch has memory in its VLAN table to store them.

Because some devices on a network may be tag-unaware, a decision must be made at each port on a tag-aware device before packets are transmitted – should the packet to be transmitted have a tag or not? If the transmitting port is connected to a tag-unaware device, the packet should be untagged. If the transmitting port is connected to a tag-aware device, the packet should be tagged.

## **Tagging and Untagging**

Every port on an 802.1Q compliant switch can be configured as tagging or untagging.

Ports with tagging enabled will put the VID number, priority and other VLAN information into the header of all packets that flow into and out of it.

If a packet has previously been tagged, the port will not alter the packet, thus keeping the VLAN information intact. Other 802.1Q compliant devices on the network to make packet-forwarding decisions can then use the VLAN information in the tag.

Ports with untagging enabled will strip the 802.1Q tag from all packets that flow into and out of those ports. If the packet doesn't have an 802.1Q VLAN tag, the port will not alter the packet. Thus, all packets received by and forwarded by an untagging port will have no 802.1Q VLAN information. (Remember that the PVID is only used internally within the Switch). Untagging is used to send packets from an 802.1Q-compliant network device to a non-compliant network device.

## **Ingress Filtering**

A port on a switch where packets are flowing into the Switch and VLAN decisions must be made is referred to as an ingress port. If ingress filtering is enabled for a port, the Switch will examine the VLAN information in the packet header (if present) and decide whether or not to forward the packet.

If the packet is tagged with VLAN information, the ingress port will first determine if the ingress port itself is a member of the VLAN. If it is not, the packet will be dropped. If the ingress port is a member of the 802.1Q VLAN, the Switch then determines if the destination port is a member of the 802.1Q VLAN. If it is not, the packet is dropped. If the destination port is a member of the 802.1Q VLAN, the packet is forwarded and the destination port transmits it to its attached network segment.

If the packet is not tagged with VLAN information, the ingress port will tag the packet with its own PVID as a VID. The switch then determines if the destination port is a member of the same VLAN (has the same VID) as the ingress port. If it does not, the packet is dropped. If it has the same VID, the packet is forwarded and the destination port transmits it on its attached network segment.

This process is referred to as ingress filtering and is used to conserve bandwidth within the Switch by dropping packets that are not on the same VLAN as the ingress port at the point of reception. This eliminates the subsequent processing of packets that will just be dropped by the destination port.

## **Default VLANs**

The Switch initially configures one VLAN, VID = 1, called "default." The factory default setting assigns all ports on the Switch to the "default." As new VLANs are configured in Port-based mode, their respective member ports are removed from the "default."

Packets cannot cross VLANs. If a member of one VLAN wants to connect to another VLAN, the link must be through an external router.

**NOTE:** If no VLANs are configured on the Switch, then all packets will be forwarded to any destination port. Packets with unknown source addresses will be flooded to all ports. Broadcast and multicast packets will also be flooded to all ports.

An example is presented below:

VLAN Name	VID	Switch Ports
System (default)	1	5, 6, 7
Engineering	2	9, 10

Sales	5	1, 2, 3, 4
-------	---	------------

## Port-based VLANs

Port-based VLANs limit traffic that flows into and out of switch ports. Thus, all devices connected to a port are members of the VLAN(s) the port belongs to, whether there is a single computer directly connected to a switch, or an entire department.

On port-based VLANs, NICs do not need to be able to identify 802.1Q tags in packet headers. NICs send and receive normal Ethernet packets. If the packet's destination lies on the same segment, communications take place using normal Ethernet protocols. Even though this is always the case, when the destination for a packet lies on another switch port, VLAN considerations come into play to decide if the packet gets dropped by the Switch or delivered.

## VLAN Segmentation

Take for example a packet that is transmitted by a machine on Port 1 that is a member of VLAN 2. If the destination lies on another port (found through a normal forwarding table lookup), the Switch then looks to see if the other port (Port 10) is a member of VLAN 2 (and can therefore receive VLAN 2 packets). If Port 10 is not a member of VLAN 2, then the packet will be dropped by the Switch and will not reach its destination. If Port 10 is a member of VLAN 2, the packet will go through. This selective forwarding feature based on VLAN criteria is how VLANs segment networks. The key point being that Port 1 will only transmit on VLAN 2.

## 802.1Q VLAN Settings

The **VLAN List** tab lists all previously configured VLANs by VLAN ID and VLAN Name.

To view the following window, click **L2 Features > VLAN > 802.1Q VLAN Settings**, as show below:

VLAN List						Add/Edit VLAN	Find VLAN	VLAN Batch Settings	Total Entries: 1
VID	VLAN Name	Advertisement	Tagged Ports	Untagged Ports	Forbidden Ports				
1	default	Enabled		1:1-1:26		<input type="button" value="Edit"/> <input type="button" value="Delete"/> <b>1/1</b> <b>1</b> <input type="button" value="Go"/>			

Figure 4-4 802.1Q VLAN Settings –VLAN List Tab window

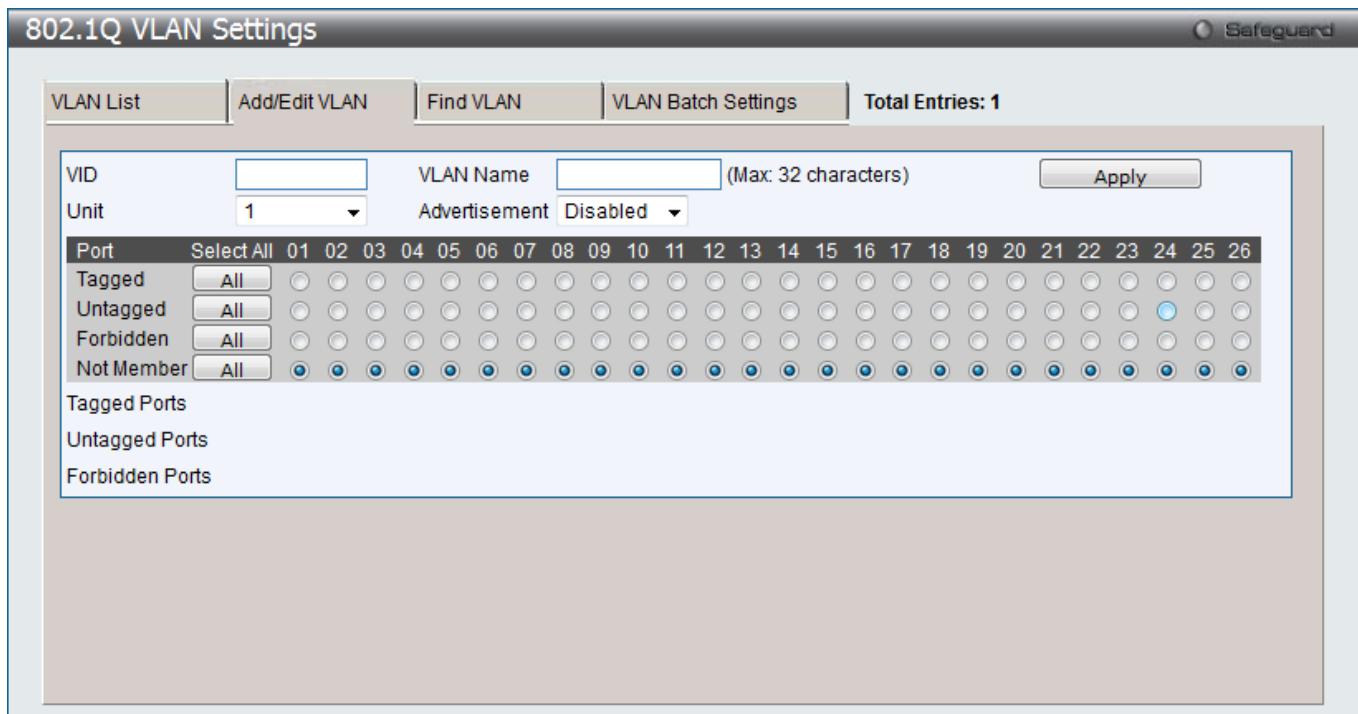

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

To create a new 802.1Q VLAN or modify an existing 802.1Q VLAN, click the **Add/Edit VLAN** tab.

A new tab will appear, as shown below, to configure the port settings and to assign a unique name and number to the new VLAN.

**Figure 4-5 802.1Q VLAN Settings – Add/Edit VLAN Tab window**

The fields that can be configured are described below:

Parameter	Description
<b>VID</b>	Allow the entry of a VLAN ID or displays the VLAN ID of an existing VLAN in the <b>Add/Edit VLAN</b> tab. VLANs can be identified by either the VID or the VLAN name.
<b>VLAN Name</b>	Allow the entry of a name for the new VLAN or for editing the VLAN name in the <b>Add/Edit VLAN</b> tab.
<b>Unit</b>	Select the unit you wish to configure.
<b>Advertisement</b>	Enable this function to allow the Switch sending out GVRP packets to outside sources, notifying that they may join the existing VLAN.
<b>Port</b>	Display all ports of the Switch for the configuration option.
<b>Tagged</b>	Specify the port as 802.1Q tagging. Clicking the radio button will designate the port as tagged. Click the <b>All</b> button to select all ports.
<b>Untagged</b>	Specify the port as 802.1Q untagged. Clicking the radio button will designate the port as untagged. Click the <b>All</b> button to select all ports.
<b>Forbidden</b>	Click the radio button to specify the port as not being a member of the VLAN and that the port is forbidden from becoming a member of the VLAN dynamically. Click the <b>All</b> button to select all ports.
<b>Not Member</b>	Click the radio button to allow an individual port to be specified as a non-VLAN member. Click the <b>All</b> button to select all ports.

Click the **Apply** button to accept the changes made.

To search for a VLAN, click the **Find VLAN** tab. A new tab will appear, as shown below.

This screenshot shows the 'Find VLAN' tab of the 802.1Q VLAN Settings interface. At the top, there are five tabs: 'VLAN List', 'Add/Edit VLAN', 'Find VLAN' (which is selected), 'VLAN Batch Settings', and 'Total Entries: 1'. Below the tabs is a search bar with a 'VID' label and a text input field containing the value '1'. To the right of the input field is a 'Find' button.

**Figure 4-6 802.1Q VLAN Settings – Find VLAN Tab window**

Enter the VLAN ID number in the field offered and then click the **Find** button. You will be redirected to the **VLAN List** tab.

To create, delete and configure a VLAN Batch entry click the **VLAN Batch Settings** tab, as shown below.

This screenshot shows the 'VLAN Batch Settings' tab of the 802.1Q VLAN Settings interface. At the top, there are five tabs: 'VLAN List', 'Add/Edit VLAN', 'Find VLAN', 'VLAN Batch Settings' (which is selected), and 'Total Entries: 1'. Below the tabs are several configuration fields:

- 'VID List (e.g.: 2-5)': An input field containing '2-5'.
- 'Advertisement': A dropdown menu set to 'Disabled'.
- 'Port List (e.g.: 1:1-1:5)': An input field containing '1:1-1:5'.
- 'Add' (radio button)
- 'Delete' (radio button)
- 'Configure' (radio button)
- 'Add' (dropdown menu)
- 'Tagged' (dropdown menu)

At the bottom right is an 'Apply' button.

**Figure 4-7 802.1Q VLAN Settings – VLAN Batch Settings Tab window**

The fields that can be configured are described below:

Parameter	Description
-----------	-------------

<b>VID List</b>	Enter a VLAN ID List that can be added, deleted or configured.
<b>Advertisement</b>	Enabling this function will allow the Switch to send out GVRP packets to outside sources, notifying that they may join the existing VLAN.
<b>Port List</b>	Allows an individual port list to be added or deleted as a member of the VLAN.
<b>Tagged</b>	Specify the port as 802.1Q tagged. Use the drop-down menu to designate the port as tagged.
<b>Untagged</b>	Specify the port as 802.1Q untagged. Use the drop-down menu to designate the port as untagged.
<b>Forbidden</b>	Specify the port as not being a member of the VLAN and that the port is forbidden from becoming a member of the VLAN dynamically. Use the drop-down menu to designate the port as forbidden.

Click the **Apply** button to accept the changes made.

**NOTE:** The Switch supports up to 4k static VLAN entries.

## 802.1v Protocol VLAN

### 802.1v Protocol Group Settings

The user can create Protocol VLAN groups and add protocols to that group. The 802.1v Protocol VLAN Group Settings support multiple VLANs for each protocol and allows the user to configure the untagged ports of different protocols on the same physical port. For example, it allows the user to configure an 802.1Q and 802.1v untagged port on the same physical port. The lower half of the table displays any previously created groups.

To view the following window, click **L2 Features > VLAN > 802.1v Protocol VLAN > 802.1v Protocol Group Settings**, as show below:

**802.1v Protocol Group Settings**

Add Protocol VLAN Group		Protocol Value (0-FFFF)		Safeguard														
Group ID (1-16)	<input type="text"/>	Group Name	<input type="text"/>	<input type="button" value="Add"/> <input type="button" value="Delete All"/>														
<b>Note:</b> Name should be less than 33 characters.																		
Add Protocol for Protocol VLAN Group		Protocol	Protocol Value (0-FFFF)	Add														
<input checked="" type="radio"/> Group ID	<input type="radio"/> Group Name	<input type="text"/>	<input type="text"/>	<input type="button" value="Add"/>														
<input type="radio"/> Ethernet II <input type="button" value="Edit"/>																		
<b>Total Entries: 1</b> <table border="1"> <thead> <tr> <th>Group ID</th> <th>Group Name</th> <th>Frame Type</th> <th>Protocol Value</th> <th>Edit</th> <th>Delete Settings</th> <th>Delete Group</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>802.1vGr...</td> <td>Ethernet II</td> <td>FFFF</td> <td><input type="button" value="Edit"/></td> <td><input type="button" value="Delete Settings"/></td> <td><input type="button" value="Delete Group"/></td> </tr> </tbody> </table>					Group ID	Group Name	Frame Type	Protocol Value	Edit	Delete Settings	Delete Group	1	802.1vGr...	Ethernet II	FFFF	<input type="button" value="Edit"/>	<input type="button" value="Delete Settings"/>	<input type="button" value="Delete Group"/>
Group ID	Group Name	Frame Type	Protocol Value	Edit	Delete Settings	Delete Group												
1	802.1vGr...	Ethernet II	FFFF	<input type="button" value="Edit"/>	<input type="button" value="Delete Settings"/>	<input type="button" value="Delete Group"/>												

Figure 4-8 802.1v Protocol Group Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Group ID</b>	Select an ID number for the group, between 1 and 16.

<b>Group Name</b>	This is used to identify the new Protocol VLAN group. Type an alphanumeric string of up to 32 characters.
<b>Protocol</b>	This function maps packets to protocol-defined VLANs by examining the type octet within the packet header to discover the type of protocol associated with it. Use the drop-down menu to toggle between <i>Ethernet II</i> , <i>IEEE802.3 SNAP</i> , and <i>IEEE802.3 LLC</i> .
<b>Protocol Value</b>	Enter a value for the Group. The protocol value is used to identify a protocol of the frame type specified. The form of the input is 0x0 to 0xffff. Depending on the frame type, the octet string will have one of the following values: For Ethernet II, this is a 16-bit (2-octet) hex value. For example, IPv4 is 800, IPv6 is 86dd, ARP is 806, etc. For IEEE802.3 SNAP, this is a 16-bit (2-octet) hex value. For IEEE802.3 LLC, this is a 2-octet IEEE 802.2 Link Service Access Point (LSAP) pair. The first octet is for Destination Service Access Point (DSAP) and the second octet is for Source.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete All** button to remove all the entries based on the information entered.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete Settings** button to remove the Protocol for the Protocol VLAN Group information for the specific entry.

Click the **Delete Group** button to remove the entry completely.

**NOTE:** The Group name value should be less than 33 characters.

## 802.1v Protocol VLAN Settings

The user can configure Protocol VLAN settings. The lower half of the table displays any previously created settings.

To view the following window, click **L2 Features > VLAN > 802.1v protocol VLAN > 802.1v Protocol VLAN Settings**, as show below:

**802.1v Protocol VLAN Settings**

**Add New Protocol VLAN**

<input checked="" type="radio"/> Group ID	1	<input checked="" type="radio"/> VID (1-4094)	<input type="text"/>	802.1p Priority	None
<input type="radio"/> Group Name	<input type="text" value="802.1vGroup"/>	<input type="radio"/> VLAN Name	<input type="text"/>		
Port List (e.g.: 1-6, all) <input type="text"/>		<input type="checkbox"/> All Ports	<input type="button" value="Add"/>		

---

**Protocol VLAN Table**

Search Port List (e.g.: 1-6, all) <input type="text"/>	<input type="button" value="Find"/>	<input type="button" value="Show All"/>	<input type="button" value="Delete All"/>
--	-------------------------------------	---	---

---

Total Entries: 1

Port	VID	VLAN Name	Group ID	802.1p Priority	Edit	Delete
1	1	default	1	-	<input type="button" value="Edit"/>	<input type="button" value="Delete"/>

Figure 4-9 802.1v Protocol VLAN Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Group ID</b>	Select a previously configured Group ID from the drop-down menu.
<b>Group Name</b>	Select a previously configured Group Name from the drop-down menu.

<b>VID (1-4094)</b>	This is the VLAN ID that, along with the VLAN Name, identifies the VLAN the user wishes to create.
<b>VLAN Name</b>	This is the VLAN Name that, along with the VLAN ID, identifies the VLAN the user wishes to create.
<b>802.1p Priority</b>	<p>This parameter is specified if you want to re-write the 802.1p default priority previously set in the Switch, which is used to determine the CoS queue to which packets are forwarded to. Once this field is specified, packets accepted by the Switch that match this priority are forwarded to the CoS queue specified previously by the user.</p> <p>Click the corresponding box if you want to set the 802.1p default priority of a packet to the value entered in the Priority (0-7) field, which meets the criteria specified previously in this command, before forwarding it on to the specified CoS queue. Otherwise, a packet will have its incoming 802.1p user priority re-written to its original value before being forwarded by the Switch.</p> <p>For more information on priority queues, CoS queues and mapping for 802.1p, see the QoS section of this manual.</p>
<b>Port List</b>	Select the specified ports you wish to configure by entering the port number in this field, or tick the <b>All Ports</b> check box.
<b>Search Port List</b>	This function allows the user to search all previously configured port list settings and display them on the lower half of the table. To search for a port list enter the port number you wish to view and click <b>Find</b> . To display all previously configured port lists on the bottom half of the screen click the <b>Show All</b> button, to clear all previously configured lists click the <b>Delete All</b> button.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Show All** button to display all the Protocol VLANs configured.

Click the **Delete All** button to remove all the entries listed.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## Asymmetric VLAN Settings

Shared VLAN Learning is a primary example of the requirement for Asymmetric VLANs. Under normal circumstances, a pair of devices communicating in a VLAN environment will both send and receive using the same VLAN; however, there are some circumstances in which it is convenient to make use of two distinct VLANs, one used for A to transmit to B and the other used for B to transmit to A in these cases Asymmetric VLANs are needed. An example of when this type of configuration might be required, would be if the client was on a distinct IP subnet, or if there was some confidentiality-related need to segregate traffic between the clients.

To view this window click **L2 Features > VLAN > Asymmetric VLAN Settings**, as show below:

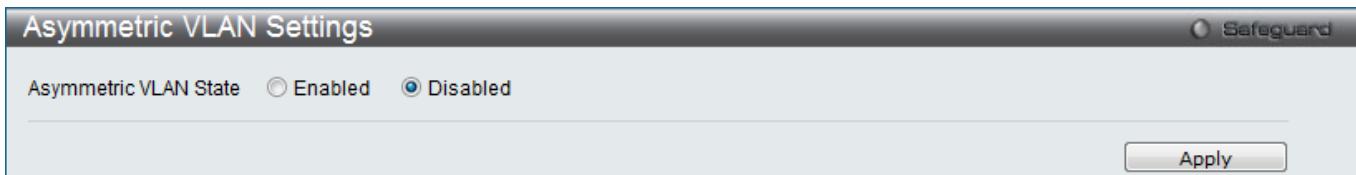

Figure 4-10 Asymmetric VLAN Settings window

Click **Apply** to implement changes.

## GVRP

## GVRP Global Settings

Users can determine whether the Switch will share its VLAN configuration information with other GARP VLAN Registration Protocol (GVRP) enabled switches. In addition, Ingress Checking can be used to limit traffic by filtering incoming packets whose VID does not match the PVID of the port. Results can be seen in the table under the configuration settings.

To view the following window, click **L2 Features > VLAN > GVRP > GVRP Global Settings**, as show below:

The screenshot shows the 'GVRP Global Settings' window. At the top, there is a radio button for 'Enabled' which is selected, and another for 'Disabled'. Below this is a section for 'GVRP Timer Settings' with three input fields: 'Join Time (100-100000)' set to 200 ms, 'Leave Time (100-100000)' set to 600 ms, and 'Leave All Time (100-100000)' set to 10000 ms. There are 'Apply' buttons next to each of these sections. At the bottom, there is a note: 'Leave Time should be greater than 2\*Join Time.' and 'Leave All Time should be greater than Leave Time.' followed by another 'Apply' button.

**Figure 4-11 GVRP Global Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>GVRP State</b>	Click the radio buttons to enable or disable the GVRP State.
<b>Join Time (100-100000)</b>	Enter the Join Time value in milliseconds.
<b>Leave Time (100-100000)</b>	Enter the Leave Time value in milliseconds.
<b>Leave All Time (100-100000)</b>	Enter the Leave All Time value in milliseconds.
<b>NNI BPDU Address</b>	Used to determine the BPDU protocol address for GVRP in service provide site. It can use 802.1d GVRP address or 802.1ad service provider GVRP address.

Click the **Apply** button to accept the changes made for each individual section.

**NOTE:** The **Leave Time** value should be greater than twice the **Join Time** value. The **Leave All Time** value should be greater than the **Leave Time** value.

## GVRP Port Settings

On this page the user can configure the GVRP port parameters.

To view the following window, click **L2 Features > VLAN > GVRP > GVRP Port Settings**, as show below:

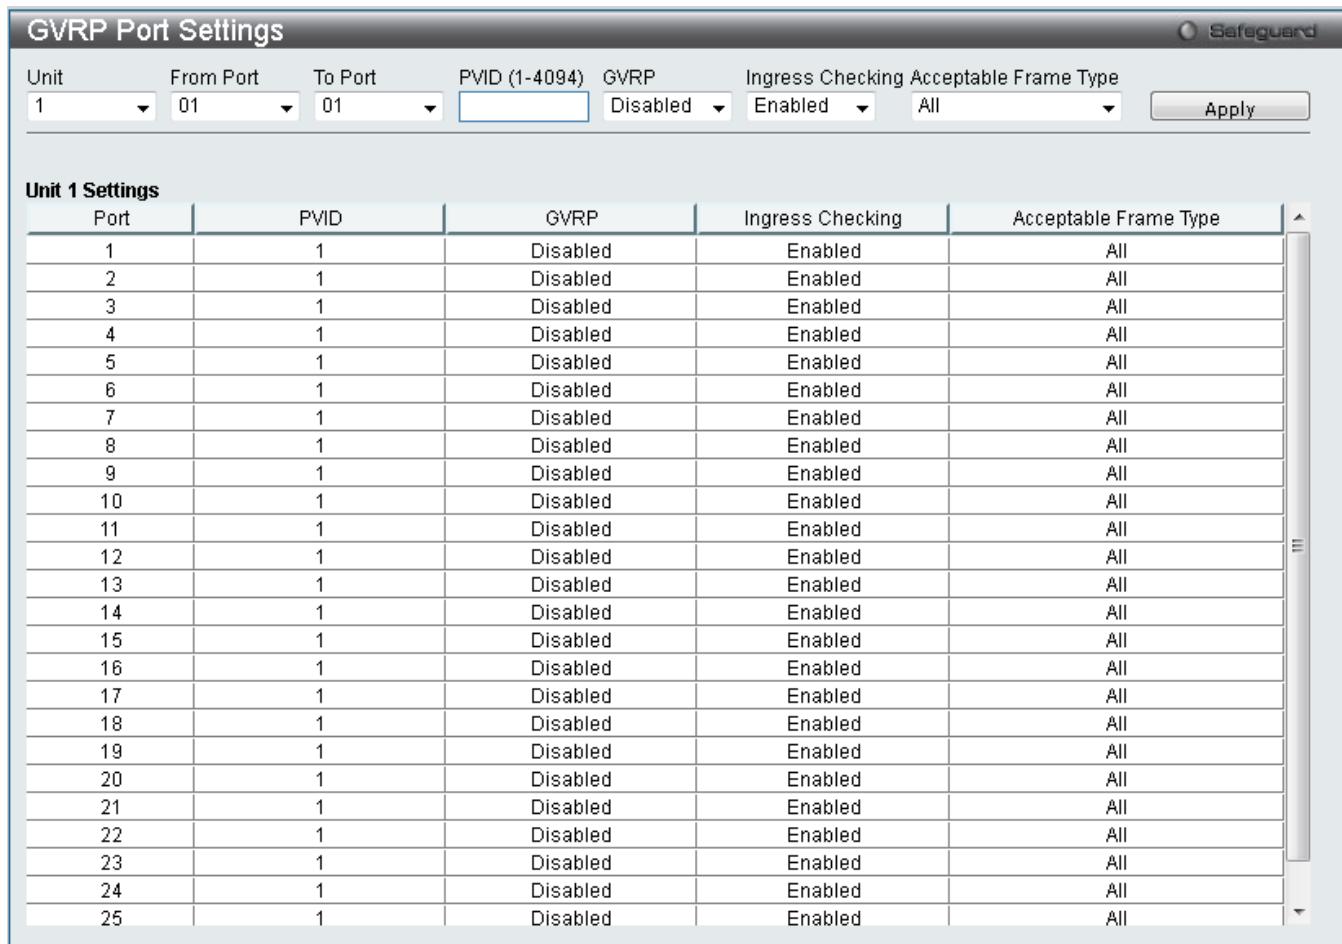

Figure 4-12 GVRP Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the starting and ending ports to use.
<b>PVID (1-4094)</b>	This field is used to manually assign a PVID to a VLAN. The Switch's default is to assign all ports to the default VLAN with a VID of 1. The PVID is used by the port to tag internally outgoing, untagged packets, and to make filtering decisions about incoming packets.
<b>GVRP</b>	The GARP VLAN Registration Protocol (GVRP) enables the port to dynamically become a member of a VLAN. GVRP is <i>Disabled</i> by default.
<b>Ingress Checking</b>	This drop-down menu allows the user to enable the port to compare the VID tag of an incoming packet with the port's VLAN setting, including PVID and tag LAN settings. If enable ingress checking and the reception port is not the member port of the frame's VLAN, the frame shall be discarded.
<b>Acceptable Frame Type</b>	This field denotes the type of frame that will be accepted by the port. The user may choose between <i>Tagged Only</i> , which means only VLAN tagged frames will be accepted, and <i>All</i> , which mean both tagged and untagged frames will be accepted. <i>All</i> is enabled by default.

Click the **Apply** button to accept the changes made.

## MAC-based VLAN Settings

Users can create new MAC-based VLAN entries, search and delete existing entries. When a static MAC-based VLAN entry is created for a user, the traffic from this user will be able to be serviced under the specified VLAN regardless of the authentication function operating on this port.

To view the following window, click **L2 Features > VLAN > MAC-based VLAN Settings**, as show below:

The screenshot shows the 'MAC-based VLAN Settings' window. At the top, there are fields for 'MAC Address' (with a dropdown menu), 'VID (1-4094)' (selected), 'VLAN Name' (radio button), 'Priority' (dropdown menu set to 'None'), and buttons for 'Find', 'Add', 'View All', and 'Delete All'. Below this is a table header: 'Total Entries: 1'. The table has columns: MAC Address, VID, Priority, Status, and Type. A single entry is listed: MAC Address 00-11-22-33-44-55, VID 1, Priority 0, Status Active, and Type Static. There is a 'Delete' button next to the entry. At the bottom right are pagination controls '1/1', '1', and 'Go'.

Total Entries: 1				
MAC Address	VID	Priority	Status	Type
00-11-22-33-44-55	1	0	Active	Static

**Figure 4-13 MAC-based VLAN Settings**

The fields that can be configured are described below:

Parameter	Description
<b>MAC Address</b>	Enter the Unicast MAC address.
<b>VID (1-4094)</b>	Select this option and enter the VLAN ID.
<b>VLAN Name</b>	Select this option and enter the VLAN name of a previously configured VLAN.
<b>Priority</b>	Use the drop-down menu to select the priority that is assigned to untagged packets.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Add** button to add a new entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Delete All** button to remove all the entries listed.

Click the **Delete** button to remove the specific entry.

## Private VLAN Settings

A private VLAN is comprised of a primary VLAN, up to one isolated VLAN, and a number of community VLANs. A private VLAN ID is presented by the VLAN ID of the primary VLAN. The command used to associate or de-associate a secondary VLAN with a primary VLAN.

### Isolated VLAN

An isolated VLAN is a secondary VLAN whose distinctive characteristic is that all hosts connected to its ports are isolated at Layer 2. Therefore, its primary advantage is that it allows a design based on private VLANs to use a total of only two VLAN identifiers to provide port isolation and serve any number of end users. A private VLAN has only one isolated VLAN.

### Community VLAN

A community VLAN is a secondary VLAN that is associated with a group of ports that connects to a certain "community" of end devices with mutual trust relationships. There can be multiple distinct community VLANs in a private VLAN domain.

A secondary VLAN cannot be associated with multiple primary VLANs. The untagged member port of the primary VLAN is named as the promiscuous port. The tagged member port of the primary VLAN is named as the trunk port. A promiscuous port of a private VLAN cannot be promiscuous port of other private VLANs. The primary VLAN member port cannot be a secondary VLAN member at the same time, or vice versa. A secondary VLAN can only have the untagged member port. The member port of a secondary VLAN cannot be member port of other secondary VLAN at the same time. When a VLAN is associated with a primary VLAN as the secondary VLAN, the promiscuous port of the primary VLAN will behave as the untagged member of the secondary VLAN, and the trunk port of the primary VLAN will behave as the tagged member of the secondary VLAN. A secondary VLAN cannot be specified with advertisement. Only the primary VLAN can be configured as a layer 3 interface. The private VLAN member port cannot be configured with the traffic segmentation function.

This window allows the user to configure the private VLAN parameters.

To view the following window, click **L2 Features > VLAN > Private VLAN Settings**, as show below:

The screenshot shows the 'Private VLAN Settings' window. At the top, there are two sections: 'Add Private VLAN' and 'Find Private VLAN'. In the 'Add Private VLAN' section, there are two radio buttons: 'VLAN Name' (selected) and 'VLAN List'. Below each is a text input field. To the right of the first input field is the label '(Max: 32 characters)' and to the right of the second is 'VID (2-4094)'. To the right of the VID field is another text input field with '(e.g.: 2, 4-6)' placeholder text. To the far right is a large 'Add' button. In the 'Find Private VLAN' section, there are also two radio buttons: 'VLAN Name' (selected) and 'VID (2-4094)'. Below each is a text input field. To the right of the first input field is the label '(Max: 32 characters)'. To the right of the VID field is a 'Find' button and a 'View All' button. Below these sections is a table header 'Total Entries: 1'. The table has three columns: VID, VLAN Name, Promiscuous Ports, and Trunk Ports. One entry is listed: VID 2, VLAN Name PVLAN. To the right of the table are 'Edit' and 'Delete' buttons. At the bottom right are page navigation buttons '1/1' and '1'.

**Figure 4-14 Private VLAN Settings window**

The fields that can be configured are described below:

Parameter	Description
VLAN Name	Enter a VLAN name.
VID (2-4094)	Enter a VID value.
VLAN List	Enter a list of VLAN ID.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Edit** button to configure the secondary VLAN.

Click the **Delete** button to remove the specific entry.

Click the **Edit** button to see the following window.

Private VLAN Settings

Private VID: 2

Private VLAN Name: PVLAN

Secondary VLAN Type: Isolated

Secondary VLAN Name:  (Max: 32 characters)

Secondary VLAN List:  (e.g.: 1, 4-6)

Add

View Private VLAN List

Private VLAN Isolated and Community Detail Table	
Isolated VLAN	Isolated Ports
Total Entries: 0	
Community VLAN	Community Ports

Figure 4-15 Private VLAN Settings - Edit window

The fields that can be configured are described below:

Parameter	Description
Secondary VLAN Type	Use the drop-down menu to select secondary VLAN type between <i>Isolated</i> or <i>Community</i> .
Secondary VLAN Name	Enter a secondary VLAN name.
Secondary VLAN List	Enter a list of secondary VLAN ID.

Click the **Add** button to add a new entry based on the information entered.

Click the [View Private VLAN List](#) link to view all the private VLAN.

## PVID Auto Assign Settings

This window is used to enable or disable PVID Auto Assign Status. The default setting is enabled.

To view the following window, click **L2 Features > VLAN > PVID Auto Assign Settings**, as show below:

PVID Auto Assign Settings

PVID Auto Assign State:  Enabled  Disabled

Apply

Figure 4-16 PVID Auto Assign Settings window

Click the **Apply** button to accept the changes made.

## Subnet VLAN

### Subnet VLAN Settings

A subnet VLAN entry is an IP subnet-based VLAN classification rule. If an untagged or priority-tagged IP packet is received on a port, its source IP address will be used to match the subnet VLAN entries. If the source IP is in the subnet of an entry, the packet will be classified to the VLAN defined for this subnet.

The user can configure the subnet VLAN parameters here.

To view the following window, click **L2 Features > VLAN > Subnet VLAN > Subnet VLAN Settings**, as show below:

**Figure 4-17 Subnet VLAN Settings Window**

The fields that can be configured are described below:

Parameter	Description
<b>VLAN Name</b>	Enter a VLAN Name.
<b>VID</b>	Enter a VLAN ID.
<b>IPv4 Network Address</b>	The user can enter the IPv4 address used in here. Remember to include the subnet mask using the / notation.
<b>IPv6 Network Address</b>	The user can enter the IPv6 address used in here. Remember to include the subnet mask using the / notation.
<b>Priority</b>	Specifies the Subnet VLAN priority value used here. Options to choose from are <b>None</b> , and <b>0 to 7</b> .
<b>VID List</b>	Enter a list of VLAN IDs.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Delete** button to remove the specific entry based on the information entered.

Click the **Show All** button to display all the existing entries.

Click the **Delete All** button to remove all the entries listed.

## VLAN Precedence Settings

This window is used to configure VLAN precedence settings.

To view the following window, click **L2 Features > VLAN > Subnet VLAN > VLAN Precedence Settings**, as show below:

The screenshot shows the 'VLAN Precedence Settings' window. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), 'To Port' (set to 01), and 'VLAN Precedence' (set to 'MAC-based VLAN'). A 'Safeguard' button is also present. Below this, a table titled 'Unit 1 Settings' lists port numbers 1 through 24, each associated with 'MAC-based VLAN' as the VLAN precedence.

Port	VLAN Precedence
1	MAC-based VLAN
2	MAC-based VLAN
3	MAC-based VLAN
4	MAC-based VLAN
5	MAC-based VLAN
6	MAC-based VLAN
7	MAC-based VLAN
8	MAC-based VLAN
9	MAC-based VLAN
10	MAC-based VLAN
11	MAC-based VLAN
12	MAC-based VLAN
13	MAC-based VLAN
14	MAC-based VLAN
15	MAC-based VLAN
16	MAC-based VLAN
17	MAC-based VLAN
18	MAC-based VLAN
19	MAC-based VLAN
20	MAC-based VLAN
21	MAC-based VLAN
22	MAC-based VLAN
23	MAC-based VLAN
24	MAC-based VLAN

Figure 4-18 VLAN Precedence Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the starting and ending ports to use.
<b>VLAN Precedence</b>	Use the drop-down menu to select the VLAN precedence as <i>MAC-based VLAN</i> or <i>Subnet VLAN</i> .

Click the **Apply** button to accept the changes made.

## Voice VLAN

### Voice VLAN Global Settings

Voice VLAN is a VLAN used to carry voice traffic from IP phone. Because the sound quality of an IP phone call will be deteriorated if the data is unevenly sent, the quality of service (QoS) for voice traffic shall be configured to ensure the transmission priority of voice packet is higher than normal traffic.

The switches determine whether a received packet is a voice packet by checking its source MAC address. If the source MAC addresses of packets comply with the organizationally unique identifier (OUI) addresses configured by the system, the packets are determined as voice packets and transmitted in voice VLAN.

To view the following window, click **L2 Features > VLAN > Voice VLAN > Voice VLAN Global Settings**, as shown below:

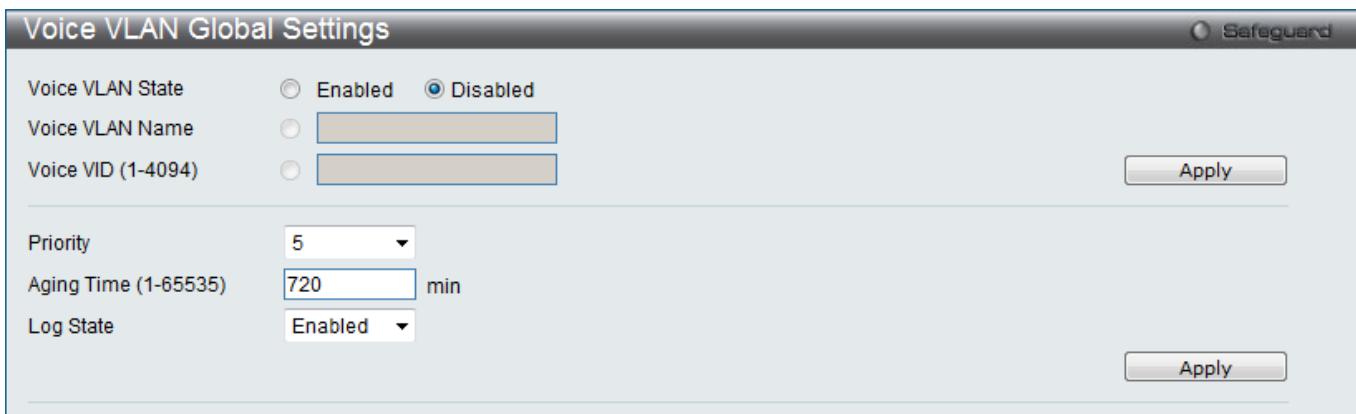

Figure 4-19 Voice VLAN Global Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Voice VLAN State</b>	The state of the voice VLAN.
<b>Voice VLAN Name</b>	The name of the voice VLAN.
<b>Voice VID (1-4094)</b>	The VLAN ID of the voice VLAN.
<b>Priority</b>	The priority of the voice VLAN, the range is 0 – 7. The default priority is 5.
<b>Aging Time (1-65535)</b>	The aging time to set, the range is 1 – 65535 minutes. The default value is 720 minutes. The aging time is used to remove a port from voice VLAN if the port is an automatic VLAN member. When the last voice device stops sending traffic and the MAC address of this voice device is aged out, the voice VLAN aging timer will be started. The port will be removed from the voice VLAN after expiration of voice VLAN aging timer. If the voice traffic resumes during the aging time, the aging timer will be reset and stop.
<b>Log State</b>	Used to enable/disable sending of issue of voice VLAN log.

Click the **Apply** button to accept the changes made for each individual section.

## Voice VLAN Port Settings

This window is used to show the ports voice VLAN information.

To view the following window, click **L2 Features > VLAN > Voice VLAN > Voice VLAN Port Settings**, as shown below:

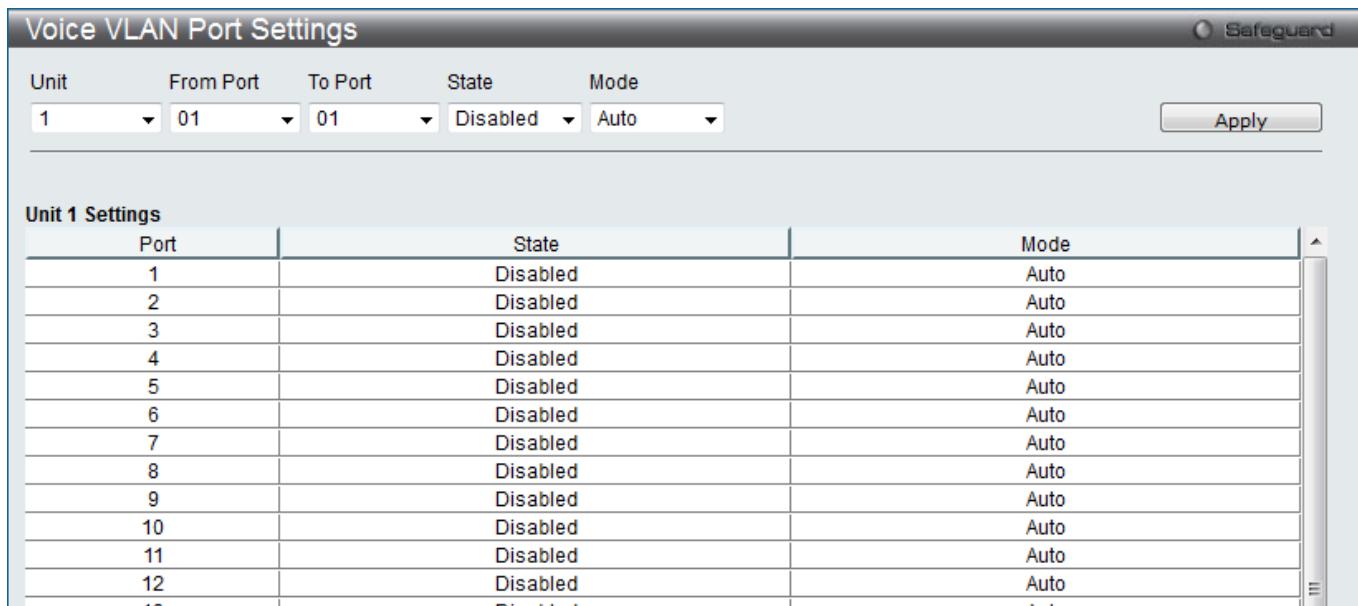

Figure 4-20 Voice VLAN Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Here the user can select a range of port to display.
<b>State</b>	Here the user can configure the state of the port.
<b>Mode</b>	Here the user can configure the mode of the port.

Click the **Apply** button to accept the changes made.

## Voice VLAN OUI Settings

This window is used to configure the user-defined voice traffic's OUI. The OUI is used to identify the voice traffic. There are a number of pre-defined OUIs. The user can further define the user-defined OUIs if needed. The user-defined OUI cannot be the same as the pre-defined OUI.

To view the following window, click **L2 Features > VLAN > Voice VLAN > Voice VLAN OUI Settings**, as show below:

Voice VLAN OUI Settings			Safeguard
OUI Address	Mask	Description	Apply
<hr/>			
<hr/>			
<b>Total Entries: 8</b>			
OUI Address	Mask	Description	
00-01-E3-00-00-00	FF-FF-FF-00-00-00	Siemens	Edit Delete
00-03-6B-00-00-00	FF-FF-FF-00-00-00	Cisco	Edit Delete
00-09-6E-00-00-00	FF-FF-FF-00-00-00	Avaya	Edit Delete
00-0F-E2-00-00-00	FF-FF-FF-00-00-00	Huawei&3COM	Edit Delete
00-60-B9-00-00-00	FF-FF-FF-00-00-00	NEC&Philips	Edit Delete
00-D0-1E-00-00-00	FF-FF-FF-00-00-00	Pingtel	Edit Delete
00-E0-75-00-00-00	FF-FF-FF-00-00-00	Veritel	Edit Delete
00-E0-BB-00-00-00	FF-FF-FF-00-00-00	3COM	Edit Delete

Figure 4-21 Voice VLAN OUI Settings window

The fields that can be configured are described below:

Parameter	Description
<b>OUI Address</b>	User defined OUI MAC address.
<b>Mask</b>	User defined OUI MAC address mask.
<b>Description</b>	The description for the user defined OUI.

Click the **Apply** button to accept the changes made.

Click the **Delete All** button to remove all the user-defined entries listed.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## Voice VLAN Device

This window is used to show voice devices that are connected to the ports. The start time is the time when the device is detected on this port, the activate time is the latest time saw the device sending the traffic.

To view the following window, click **L2 Features > VLAN > Voice VLAN > Voice VLAN Device**, as show below:

Voice VLAN Device				Safeguard
Unit	1			
<hr/>				
<b>Total Entries: 0</b>	Port	Voice Device	Start Time	Last Active Time

Figure 4-22 Voice VLAN Device window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to display.

## Voice VLAN LLDP-MED Voice Device

This window displays the voice VLAN LLDP-MED voice devices connected to the Switch.

To view the following window, click **L2 Features > VLAN > Voice VLAN > Voice VLAN LLDP-MED Voice Device**, as show below:

Index	Local Port	Chassis ID	Subtype	Chassis ID	Port ID	Subtype	Port ID	Create Time	Remain Time
Total Entries: 0									

**Figure 4-23 Voice VLAN LLDP-MED Voice Device window**

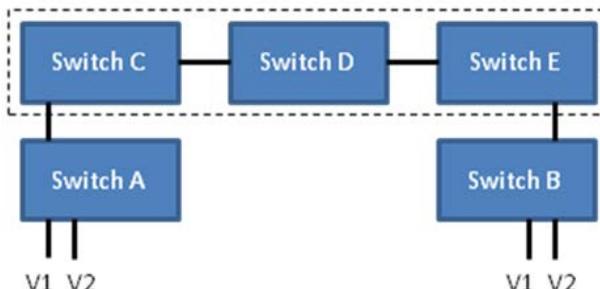

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## VLAN Trunk Settings

Enable VLAN on a port to allow frames belonging to unknown VLAN groups to pass through that port. This is useful if you want to set up VLAN groups on end devices without having to configure the same VLAN groups on intermediary devices.

Suppose you want to create VLAN groups 1 and 2 (V1 and V2) on devices A and B. Without a VLAN Trunk, you must first configure VLAN groups 1 and 2 on all intermediary switches C, D and E; otherwise they will drop frames with unknown VLAN group tags. However, with VLAN Trunk enabled on a port(s) in each intermediary switch, you only need to create VLAN groups in the end devices (A and B). C, D and E automatically allow frames with VLAN group tags 1 and 2 (VLAN groups that are unknown to those switches) to pass through their VLAN trunking port(s).

Refer to the following figure for an illustrated example.

**Figure 4-24 Example of VLAN Trunk**

Users can combine a number of VLAN ports together to create VLAN trunks.

To view the following window, click **L2 Features > VLAN > VLAN Trunk Settings**, as show below:

Select All	Clear All	Apply
Unit	1	
Port	01 02 03 04 05 06 07 08 09 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26	
Ports:		

**Figure 4-25 VLAN Trunk Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>VLAN Trunk State</b>	Enable or disable the VLAN trunking global state.
<b>Unit</b>	Select the unit you wish to configure.
<b>Ports</b>	The ports to be configured. By clicking the <b>Select All</b> button, all the ports will be included. By clicking the <b>Clear All</b> button, all the ports will not be included.

Click the **Apply** button to accept the changes made for each individual section.

## Browse VLAN

Users can display the VLAN status for each of the Switch's ports viewed by VLAN. Enter a VID (VLAN ID) in the field at the top of the window and click the **Find** button.

To view the following window, click **L2 Features > VLAN > Browse VLAN**, as show below:

The screenshot shows the 'Browse VLAN' interface. At the top, there is a search bar labeled 'VID' with a placeholder box and a 'Find' button. Below the search bar, detailed VLAN information is displayed for VID 1:

- VID: 1
- VLAN Name: default
- VLAN Type: Static
- Advertisement: Enabled

Below this, a message states 'Total Entries: 1'. A table follows, showing port assignments for Unit 1 across 26 ports (01 to 26). The table uses abbreviations: 'U' for Untagged Port, 'T' for Tagged Port, and 'F' for Forbidden Port. The first row of the table header is 'Port' and the second row is 'Unit'. The data shows that every port is an Untagged Port ('U') for Unit 1.

	Port																									
Unit	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26
1	U	U	U	U	U	U	U	U	U	U	U	U	U	U	U	U	U	U	U	U	U	U	U	U	U	

At the bottom right, there are page navigation buttons: '1/1' (current page), '1' (page number), and a 'Go' button.

**Note:** T: Tagged Port, U: Untagged Port, F: Forbidden Port

**Figure 4-26 Browse VLAN window**

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

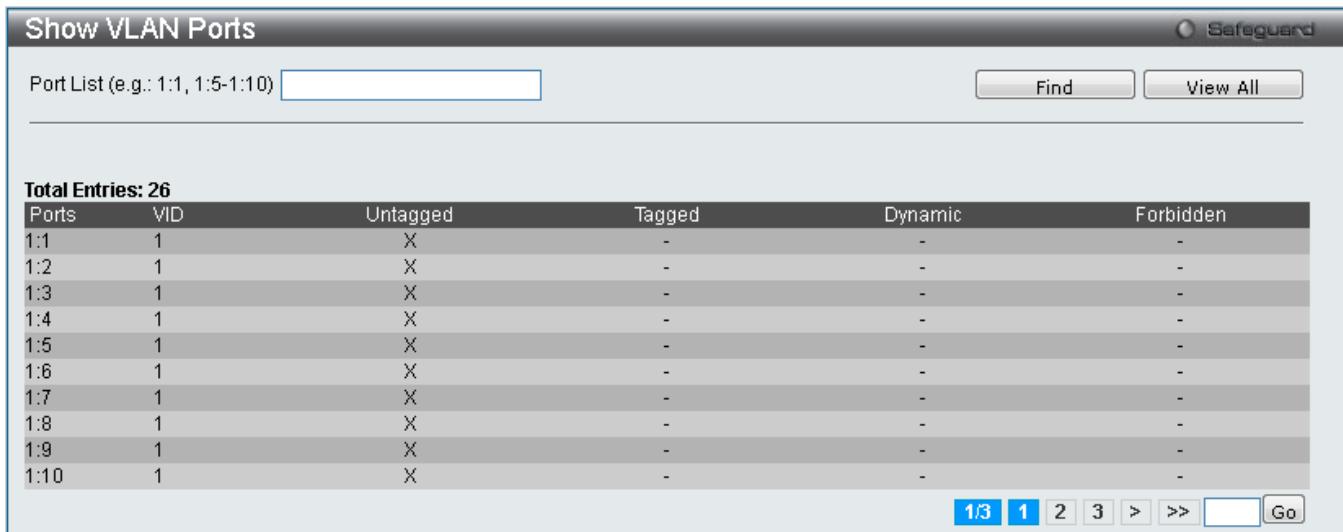

**NOTE:** The abbreviations used on this page are **Tagged Port (T)**, **Untagged Port (U)** and **Forbidden Port (F)**.

## Show VLAN Ports

Users can display the VLAN ports of the Switch's viewed by VID. Enter a Port or a **Port List** in the field at the top of the window and click the **Find** button.

To view the following window, click **L2 Features > VLAN > Show VLAN Ports**, as show below:

**Figure 4-27 Show VLAN Ports window**

Click the **View All** button to display all the existing entries.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

QinQ

Q-in-Q VLANs allow network providers to expand their VLAN configurations to place customer VLANs within a larger inclusive VLAN, which adds a new layer to the VLAN configuration. This basically lets large ISP's create L2 Virtual Private Networks and also create transparent LANs for their customers, which will connect two or more customer LAN points without over-complicating configurations on the client's side. Not only will over-complication be avoided, but also now the administrator has over 4000 VLANs in which over 4000 VLANs can be placed, therefore greatly expanding the VLAN network and enabling greater support of customers utilizing multiple VLANs on the network.

Q-in-Q VLANs are basically VLAN tags placed within existing IEEE 802.1Q VLANs which we will call SPVIDs (Service Provider VLAN IDs). These VLANs are marked by a TPID (Tagged Protocol ID), configured in hex form to be encapsulated within the VLAN tag of the packet. This identifies the packet as double-tagged and segregates it from other VLANs on the network, therefore creating a hierarchy of VLANs within a single packet.

Here is an example Q-in-Q VLAN tagged packet.

Destination Address	Source Address	SPVLAN (TPID + Service Provider VLAN Tag)	802.1Q CEVLAN Tag (TPID + Customer VLAN Tag)	Ether Type	Payload
---------------------	----------------	---	--	------------	---------

Consider the example below:

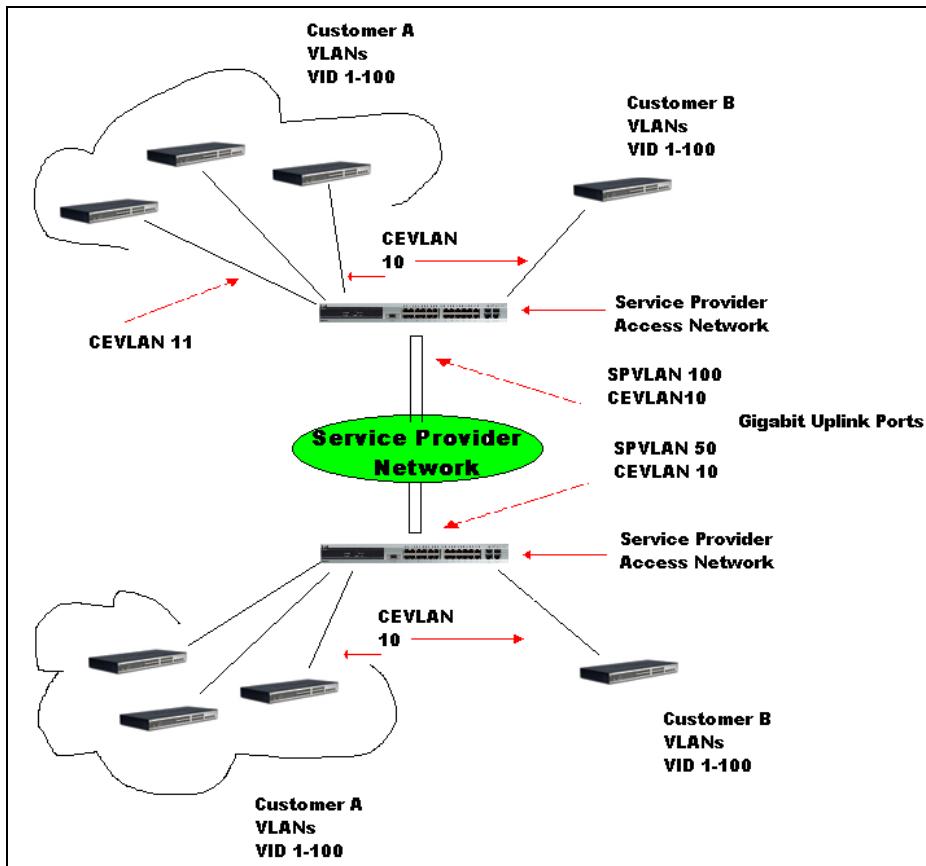

Figure 4-28 QinQ example window

In this example, the Service Provider Access Network switch (Provider edge switch) is the device creating and configuring Q-in-Q VLANs. Both CEVLANS (Customer VLANs), 10 and 11, are tagged with the SPVID 100 on the Service Provider Access Network and therefore belong to one VLAN on the Service Provider's network, thus being a member of two VLANs. In this way, the Customer can retain its normal VLAN and the Service Provider can congregate multiple Customer VLANs within one SPVLAN, thus greatly regulating traffic and routing on the Service Provider switch. This information is then routed to the Service Provider's main network and regarded there as one VLAN, with one set of protocols and one routing behavior.

### Regulations for Q-in-Q VLANs

1. Some rules and regulations apply with the implementation of the Q-in-Q VLAN procedure.
2. Ports can be configured as UNI ports or NNI ports. Both UNI and NNI ports can be configured as Gigabit ports.
3. Provider Edge switches must allow frames of at least 1522 bytes or more, due to the addition of the SPVID tag.
4. UNI ports can be an untagged or a tagged port of the service provider VLAN. NNI ports must be a tagged port of the service provider VLANs.
5. The switch cannot have both double and normal VLANs co-existing. Once the change of VLAN is made, all Access Control lists are cleared and must be reconfigured.
6. When Q-in-Q VLANs are enabled, GVRP can work with Q-in-Q VLANs.
7. The tags of all packets sent from the CPU to the UNI ports must be striped or replaced.
8. The following functions will not operate when the switch is in Q-in-Q VLAN mode:
  - Guest VLANs.
  - Web-based Access Control.
  - IP Multicast Routing.
  - All Regular 802.1Q VLAN functions.

## QinQ Settings

The user can configure the Q-in-Q parameters in this page.

To view the following window, click **L2 Features > QinQ > QinQ Settings**, as show below:

The screenshot shows the 'QinQ Settings' window. At the top, there's a 'QinQ Global Settings' section with a 'QinQ State' radio button set to 'Disabled'. Below it is an 'Inner TPID' field set to '0x 8100 (hex : 0x1-0xffff)'. There are two 'Apply' buttons. The main area contains a table for 'Unit 1 Settings' with 16 rows, each representing a port from 1 to 16. The columns are Port, Role, Missdrop, Outer TPID, Use Inner Priority, and Add Inner Tag. All entries in the table are 'Disabled' except for Port 1 which has '0x88A8' in the Outer TPID column. A 'Safeguard' icon is in the top right corner.

Unit 1 Settings					
Port	Role	Missdrop	Outer TPID	Use Inner Priority	Add Inner Tag
1	NNI	Disabled	0x88A8	Disabled	Disabled
2	NNI	Disabled	0x88A8	Disabled	Disabled
3	NNI	Disabled	0x88A8	Disabled	Disabled
4	NNI	Disabled	0x88A8	Disabled	Disabled
5	NNI	Disabled	0x88A8	Disabled	Disabled
6	NNI	Disabled	0x88A8	Disabled	Disabled
7	NNI	Disabled	0x88A8	Disabled	Disabled
8	NNI	Disabled	0x88A8	Disabled	Disabled
9	NNI	Disabled	0x88A8	Disabled	Disabled
10	NNI	Disabled	0x88A8	Disabled	Disabled
11	NNI	Disabled	0x88A8	Disabled	Disabled
12	NNI	Disabled	0x88A8	Disabled	Disabled
13	NNI	Disabled	0x88A8	Disabled	Disabled
14	NNI	Disabled	0x88A8	Disabled	Disabled
15	NNI	Disabled	0x88A8	Disabled	Disabled
16	NNI	Disabled	0x88A8	Disabled	Disabled

Figure 4-29 QinQ Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>QinQ State</b>	Selecting this option enable the Q-in-Q feature.
<b>Inner TPID</b>	Enter an Inner TPID in customer VLAN tag here.
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Here the user can select a range of ports to use in the configuration.
<b>Role</b>	Port role in Q-in-Q mode, it can be UNI port or NNI port.
<b>Missdrop</b>	This option enables or disables C-VLAN based SP-VLAN assignment miss drop. If Missdrop is enabled, the packet that does not match any assignment rule in the VLAN translation and Q-in-Q profile, will be dropped. If disabled, then the packet will be forwarded and will be assigned to the PVID of the received port.
<b>Outer TPID</b>	Enter an Outer TPID in SP-VLAN tag here.
<b>Use Inner Priority</b>	Use the drop-down menu to specify whether to use the priority in the C-VLAN tag as the priority in the S-VLAN tag. By default, the setting is Disabled.

<b>Add Inner Tag</b>	Deselect the <b>Disable</b> check box and enter an entry that an Inner Tag will be added to the entry. By default the <b>Disabled</b> check box is selected.
----------------------	--

Click the **Apply** button to accept the changes made for each individual section.

## VLAN Translation Settings

This page can be used to add translation relationship between C-VLAN and SP-VLAN. On ingress at UNI port, the C-VLAN tagged packets will be translated to SP-VLAN tagged packets by adding or replacing according the configured rule. On egress at this port, the SP-VLAN tag will be recovered to C-VLAN tag or be striped. The priority will be the priority in the SP-VLAN tag if the inner priority flag is disabled for the receipt port.

To view the following window, click **L2 Features > QinQ > VLAN Translation Settings**, as show below:

VLAN Translation Settings							Safeguard
Unit	From Port	To Port	CVID (1, 5-7)	Action	SVID (1-4094)	Priority	
1	01	01		Add		None	<b>Apply</b>
							<b>Delete All</b>
<b>Total Entries: 0</b>							
Port	CVID	SVID	Action	Priority			

Figure 4-30 VLAN Translation Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select a range of ports to use in the configuration.
<b>CVID (1, 5-7)</b>	Enter the C-VLAN ID to match.
<b>Action</b>	The action indicates to add an S-tag before a C-tag or to replace the original C-tag by an S-tag.
<b>SVID (1-4094)</b>	Enter the SP-VLAN ID.
<b>Priority</b>	Select the priority of the s-tag.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Delete All** button to remove all the entries listed.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove a specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## VLAN Translation Port Mapping Settings

Here the user can configure the VLAN translation port mapping settings.

To view the following window, click **L2 Features > QinQ > VLAN Translation Port Mapping Settings**, as show below:

Figure 4-31 VLAN Translation Port Mapping Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select a range of ports to use in the configuration.
<b>VLAN Translation Profile (1-4)</b>	Select the VLAN translation profile that will be configured here.
<b>Action</b>	The action indicates to add a VLAN translation profile to the ports selected.

Click the **Apply** button to accept the changes made for each individual section.

## VLAN Translation Profile List

Here the user can configure the VLAN translation profile list.

To view the following window, click **L2 Features > QinQ > VLAN Translation Profile List**, as show below:

The screenshot shows a table with a single row of data. The columns are labeled: Profile ID, Rule ID, Rule Status, Active Port, Action, SVID, and Priority. The data row contains: 1, 1, Inactive, Add, 1, -1. Below the table are several buttons: Add QinQ Profile, View All, Delete All, Show Match, and Delete.

Total Entries: 1						
Profile ID	Rule ID	Rule Status	Active Port	Action	SVID	Priority
1	1	Inactive		Add	1	-1

**Add QinQ Profile**   **View All**   **Delete All**  
**Show Match**   **Delete**

Figure 4-32 VLAN Translation Profile List window

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID (1-4)</b>	Enter the VLAN translation profile ID used here.

Click the **Find** button to locate the profile entered.

Click the **Add QinQ Profile** button to add a QinQ profile to the VLAN translation profile list.

Click the **View All** button to view all the configured profiles.

Click the **Delete All** button to delete all configured profiles.

Click the **Show Match** button to view the QinQ VLAN Translation Rule Information.

Click the **Delete** button to remove the specific entry.

After clicking the **Add QinQ Profile** button, the following page will be available:

This screenshot shows a configuration form for adding a QinQ profile. It includes fields for Source MAC, Destination MAC, Source IP, Destination IP, L4 Source Port, L4 Destination Port, Outer VID List, 802.1p priority, and IP Protocol. On the right side, there are fields for Rule ID (1-128), Priority (None), Source Mask, Destination Mask, Source IP Mask, Destination IP Mask, and Action (Add). At the bottom are Apply and Back buttons.

VLAN Translation Profile Configuration		
Profile ID (1-4) 1	Rule ID (1-128)	Action Add
SVID (1-4094)	Priority None	Source Mask
Source MAC	Destination Mask	Destination IP Mask
Destination MAC	Source IP Mask	L4 Destination Port
Source IP	Destination IP Mask	
Destination IP		
L4 Source Port		
Outer VID List		
802.1p None		
IP Protocol		

**Apply**   **<< Back**

Figure 4-33 VLAN Translation Profile List window (Add QinQ Profile)

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID (1-4)</b>	Select the profile ID to configure
<b>Rule ID (1-128)</b>	Enter the rule ID to be added to the profile. If the rule ID is not specified, it will be assigned automatically.

<b>Action</b>	Select the action that will be taken here. Options to choose from are <b>Add</b> and <b>Replace</b> . Add specifies to add a tag for the assigned S-VLAN before the Outer-VLAN tag. If there is an S-TAG in the packet, this rule will not take effect. Replace specifies to replace the outer-VLAN ID in the tag by the SVID. If there is no TAG in the packet, this rule will not take effect.
<b>SVID (1-4094)</b>	Enter the S-VLAN ID to be assigned to the matched packet.
<b>Priority</b>	Select the 802.1p priority of the S-Tag. If the priority is not specified, the 802.1p priority of S-Tag will be assigned by the default procedure.
<b>Source MAC</b>	Enter the source MAC address or MAC address range for the match.
<b>Source Mask</b>	Enter the source MAC address mask.
<b>Destination MAC</b>	Enter the destination MAC address or MAC address range for the match.
<b>Destination Mask</b>	Enter the destination MAC address mask.
<b>Source IP</b>	Enter the source IPv4 address or IPv4 subnet for the match.
<b>Source IP Mask</b>	Enter the source IPv4 address mask used.
<b>Destination IP</b>	Enter the destination IPv4 address or IPv4 subnet for the match.
<b>Destination IP Mask</b>	Enter the destination IPv4 address mask used.
<b>L4 Source Port</b>	Enter the Layer 4 source port ID for the match.
<b>L4 Destination Port</b>	Enter the Layer 4 destination port ID for the match.
<b>Outer VID List</b>	Enter the packet's outer-VID for the match.
<b>802.1p</b>	Select the packet's 802.1p priority for the match.
<b>IP Protocol</b>	Enter the IP protocol number used. This value must be between 0 and 255.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes and return to the previous page.

After clicking the **Show Match** button, the following page will be available:

VLAN Translation Profile List	
<b>QinQ VLAN Translation Rule Information</b>	
Profile ID	1
Rule ID	1
Source MAC	00-11-22-33-44-55
Source MAC Mask	FF-FF-FF-FF-FF-FF
Destination MAC	00-22-33-44-55-66
Destination MAC Mask	FF-FF-FF-FF-FF-FF

Click the **Show All VLAN Translation Profile** button to the return to the main page.

## Layer 2 Protocol Tunneling Settings

This window is used to configure the layer 2 Protocol tunneling port settings.

To view the following window, click **L2 Features > Layer 2 Protocol Tunneling Settings**, as show below:

**Layer 2 Protocol Tunneling Global Settings**

Layer 2 Protocol Tunneling State:  Enabled  Disabled

UNI Ports: 1:1

NNI Ports:

---

**Layer 2 Protocol Tunneling Port Settings**

Unit	From Port	To Port	Type	Tunneled Protocol	Threshold (0-65535)
1	01	01	UNI	STP	01-00-0C-CC-CC-CC

---

UNI Port	Tunneled Protocol	Threshold (packet/sec)
1:1	STP	0

Figure 4-35 Layer 2 Protocol Tunneling Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Layer 2 protocol tunneling State</b>	Use the radio buttons to enable or disable the layer 2 protocol tunneling function globally on the Switch.
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select a range of ports to use in the configuration.
<b>Type</b>	Use the drop-down menu to select the type of the ports. Available choices are <i>UNI</i> , <i>NNI</i> and <i>None</i> . The default type is None.
<b>Tunneled Protocol</b>	When <i>UNI</i> is selected in the <b>Type</b> drop-down menu, this drop-down menu shows the following options: <i>STP</i> - Specify the BPDU received on these UNI will be tunneled. <i>GVRP</i> - Specify the GVRP PDU received on these UNI will be tunneled. <i>Protocol MAC</i> - Specify the destination MAC address of the L2 protocol packets that will tunneled on these UNI ports. At present, the MAC address can be 01-00-0C-CC-CC-CC or 01-00-0C-CC-CC-CD. <i>All</i> - Specify all supported.
<b>Threshold (0-65535)</b>	Enter the drop threshold for packets-per-second accepted on this UNI port. The port drops the PDU if the protocol's threshold is exceeded. The range of the threshold value is 0 to 65535 (packet/second). The value 0 means unlimited. By default, the value is 0.

Click the **Apply** button to accept the changes made for each individual section.

## Spanning Tree

This Switch supports three versions of the Spanning Tree Protocol: 802.1D-1998 STP, 802.1D-2004 Rapid STP, and 802.1Q-2005 MSTP. 802.1D-1998 STP will be familiar to most networking professionals. However, since 802.1D-2004 RSTP and 802.1Q-2005 MSTP have been recently introduced to D-Link managed Ethernet switches, a brief introduction to the technology is provided below followed by a description of how to set up 802.1D-1998 STP, 802.1D-2004 RSTP, and 802.1Q-2005 MSTP.

### **802.1Q-2005 MSTP**

Multiple Spanning Tree Protocol, or MSTP, is a standard defined by the IEEE community that allows multiple VLANs to be mapped to a single spanning tree instance, which will provide multiple pathways across the network. Therefore, these MSTP configurations will balance the traffic load, preventing wide scale disruptions when a single spanning tree instance fails. This will allow for faster convergences of new topologies for the failed instance. Frames designated for these VLANs will be processed quickly and completely throughout interconnected bridges utilizing any of the three spanning tree protocols (STP, RSTP or MSTP).

This protocol will also tag BPDU packets so receiving devices can distinguish spanning tree instances, spanning tree regions and the VLANs associated with them. An MSTI ID will classify these instances. MSTP will connect multiple spanning trees with a Common and Internal Spanning Tree (CIST). The CIST will automatically determine each MSTP region, its maximum possible extent and will appear as one virtual bridge that runs a single spanning tree. Consequentially, frames assigned to different VLANs will follow different data routes within administratively established regions on the network, continuing to allow simple and full processing of frames, regardless of administrative errors in defining VLANs and their respective spanning trees.

Each switch utilizing the MSTP on a network will have a single MSTP configuration that will have the following three attributes:

1. A configuration name defined by an alphanumeric string of up to 32 characters (defined in the **MST Configuration Identification** window in the Configuration Name field).
2. A configuration revision number (named here as a Revision Level and found in the **MST Configuration Identification** window) and;
3. A 4094-element table (defined here as a VID List in the **MST Configuration Identification** window), which will associate each of the possible 4094 VLANs supported by the Switch for a given instance.

To utilize the MSTP function on the Switch, three steps need to be taken:

1. The Switch must be set to the MSTP setting (found in the **STP Bridge Global Settings** window in the STP Version field)
2. The correct spanning tree priority for the MSTP instance must be entered (defined here as a Priority in the **MSTI Config Information** window when configuring MSTI ID settings).
3. VLANs that will be shared must be added to the MSTP Instance ID (defined here as a VID List in the **MST Configuration Identification** window when configuring an MSTI ID settings).

### **802.1D-2004 Rapid Spanning Tree**

The Switch implements three versions of the Spanning Tree Protocol, the Multiple Spanning Tree Protocol (MSTP) as defined by the IEEE 802.1Q-2005, the Rapid Spanning Tree Protocol (RSTP) as defined by the IEEE 802.1D-2004 specification and a version compatible with the IEEE 802.1D-1998 STP. RSTP can operate with legacy equipment implementing IEEE 802.1D-1998; however the advantages of using RSTP will be lost.

The IEEE 802.1D-2004 Rapid Spanning Tree Protocol (RSTP) evolved from the 802.1D-1998 STP standard. RSTP was developed in order to overcome some limitations of STP that impede the function of some recent switching innovations, in particular, certain Layer 3 functions that are increasingly handled by Ethernet switches. The basic function and much of the terminology is the same as STP. Most of the settings configured for STP are also used for RSTP. This section introduces some new Spanning Tree concepts and illustrates the main differences between the two protocols.

### **Port Transition States**

An essential difference between the three protocols is in the way ports transition to a forwarding state and in the way this transition relates to the role of the port (forwarding or not forwarding) in the topology. MSTP and RSTP combine the transition states disabled, blocking and listening used in 802.1D-1998 and creates a single state Discarding. In either case, ports do not forward packets. In the STP port transition states disabled, blocking or listening or in the RSTP/MSTP port state discarding, there is no functional difference, the port is not active in the network topology. Table 7-3 below compares how the three protocols differ regarding the port state transition.

All three protocols calculate a stable topology in the same way. Every segment will have a single path to the root bridge. All bridges listen for BPDU packets. However, BPDU packets are sent more frequently - with every Hello packet. BPDU packets are sent even if a BPDU packet was not received. Therefore, each link between bridges is sensitive to the status of the link. Ultimately this difference results in faster detection of failed links, and thus faster topology adjustment. A drawback of 802.1D-1998 is this absence of immediate feedback from adjacent bridges.

<b>802.1Q-2005 MSTP</b>	<b>802.1D-2004 RSTP</b>	<b>802.1D-1998 STP</b>	<b>Forwarding</b>	<b>Learning</b>
Disabled	Disabled	Disabled	No	No
<i>Discarding</i>	<i>Discarding</i>	<i>Blocking</i>	No	No
<i>Discarding</i>	<i>Discarding</i>	<i>Listening</i>	No	No
<i>Learning</i>	<i>Learning</i>	<i>Learning</i>	No	<b>Yes</b>
<b>Forwarding</b>	<b>Forwarding</b>	<b>Forwarding</b>	<b>Yes</b>	<b>Yes</b>

RSTP is capable of a more rapid transition to a forwarding state - it no longer relies on timer configurations - RSTP compliant bridges are sensitive to feedback from other RSTP compliant bridge links. Ports do not need to wait for the topology to stabilize before transitioning to a forwarding state. In order to allow this rapid transition, the protocol introduces two new variables: the edge port and the point-to-point (P2P) port.

### **Edge Port**

The edge port is a configurable designation used for a port that is directly connected to a segment where a loop cannot be created. An example would be a port connected directly to a single workstation. Ports that are designated as edge ports transition to a forwarding state immediately without going through the listening and learning states. An edge port loses its status if it receives a BPDU packet, immediately becoming a normal spanning tree port.

### **P2P Port**

A P2P port is also capable of rapid transition. P2P ports may be used to connect to other bridges. Under RSTP/MSTP, all ports operating in full-duplex mode are considered to be P2P ports, unless manually overridden through configuration.

### **802.1D-1998/802.1D-2004/802.1Q-2005 Compatibility**

MSTP or RSTP can interoperate with legacy equipment and is capable of automatically adjusting BPDU packets to 802.1D-1998 format when necessary. However, any segment using 802.1D-1998 STP will not benefit from the rapid transition and rapid topology change detection of MSTP or RSTP. The protocol also provides for a variable used for migration in the event that legacy equipment on a segment is updated to use RSTP or MSTP.

The Spanning Tree Protocol (STP) operates on two levels:

1. On the switch level, the settings are globally implemented.
2. On the port level, the settings are implemented on a per-user-defined group of ports basis.

## **STP Bridge Global Settings**

On this page the user can configure the STP bridge global parameters.

To view the following window, click **L2 Features > Spanning Tree > STP Bridge Global Settings**, as show below:

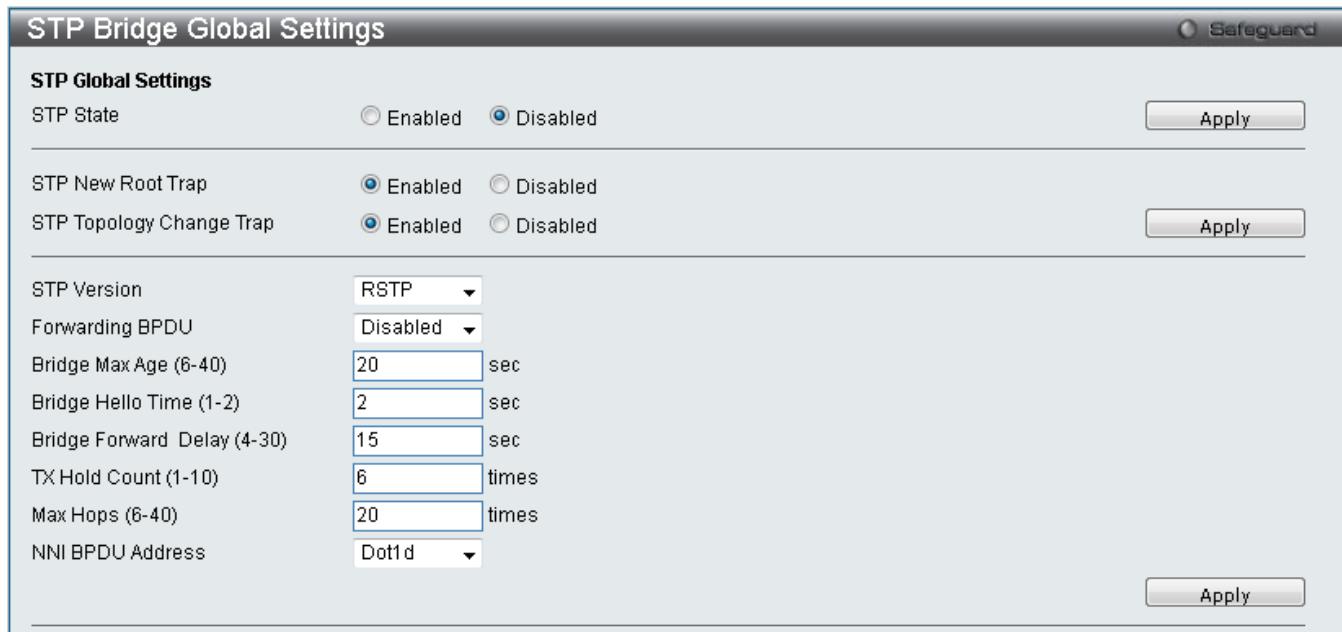

Figure 4-36 STP Bridge Global Settings window

The fields that can be configured are described below:

Parameter	Description
<b>STP Status</b>	Use the radio button to globally enable or disable STP.
<b>STP New Root Trap</b>	Click to enable or disable sending new root traps.
<b>STP Topology Change Trap</b>	Click to enable or disable sending topology change traps.
<b>STP Version</b>	Use the drop-down menu to choose the desired version of STP: <i>STP</i> - Select this parameter to set the Spanning Tree Protocol (STP) globally on the switch. <i>RSTP</i> - Select this parameter to set the Rapid Spanning Tree Protocol (RSTP) globally on the Switch. <i>MSTP</i> - Select this parameter to set the Multiple Spanning Tree Protocol (MSTP) globally on the Switch.
<b>Forwarding BPDU</b>	This field can be <i>Enabled</i> or <i>Disabled</i> . When <i>Enabled</i> , it allows the forwarding of STP BPDU packets from other network devices. The default is <i>Disabled</i> .
<b>Bridge Max Age (6-40)</b>	The Max Age may be set to ensure that old information does not endlessly circulate through redundant paths in the network, preventing the effective propagation of the new information. Set by the Root Bridge, this value will aid in determining that the Switch has spanning tree configuration values consistent with other devices on the bridged LAN. The user may choose a time between 6 and 40 seconds. The default value is 20 seconds.
<b>Bridge Hello Time (1-2)</b>	The Hello Time can be set from 1 to 2 seconds. This is the interval between two transmissions of BPDU packets sent by the Root Bridge to tell all other switches that it is indeed the Root Bridge. This field will only appear here when STP or RSTP is selected for the STP Version. For MSTP, the Hello Time must be set on a port per port basis. The default is 2 seconds.
<b>Bridge Forward Delay (4-30)</b>	The Forward Delay can be from 4 to 30 seconds. Any port on the Switch spends this time in the listening state while moving from the blocking state to the forwarding state. The default is 15 seconds.

<b>Tx Hold Count (1-10)</b>	Used to set the maximum number of Hello packets transmitted per interval. The count can be specified from 1 to 10. The default is 6.
<b>Max Hops (6-40)</b>	Used to set the number of hops between devices in a spanning tree region before the BPDU (bridge protocol data unit) packet sent by the Switch will be discarded. Each switch on the hop count will reduce the hop count by one until the value reaches zero. The Switch will then discard the BDPU packet and the information held for the port will age out. The user may set a hop count from 6 to 40. The default is 20.
<b>NNI BPDU Address</b>	Used to determine the BPDU protocol address for GVRP in service provider site. It can use 802.1d GVRP address, 802.1ad service provider GVRP address or a user defined multicast address. The range of the user defined address is 0180C2000000 - 0180C2FFFFFF.

Click the **Apply** button to accept the changes made for each individual section.

**NOTE:** The Bridge Hello Time cannot be longer than the Bridge Max Age. Otherwise, a configuration error will occur. Observe the following formulas when setting the above parameters:

Bridge Max Age <= 2 x (Bridge Forward Delay - 1 second)

Bridge Max Age > 2 x (Bridge Hello Time + 1 second)

## STP Port Settings

STP can be set up on a port per port basis.

To view the following window, click **L2 Features > Spanning Tree > STP Port Settings**, as show below:

**STP Port Settings**

Unit	<input type="button" value="1"/>	From Port	<input type="button" value="01"/>	To Port	<input type="button" value="01"/>			
External Cost (0 = Auto)	<input type="text" value="0"/>	Migrate	<input type="button" value="Yes"/>	Edge	<input type="button" value="False"/>			
P2P	<input type="button" value="Auto"/>	Port STP	<input type="button" value="Enabled"/>	Restricted Role	<input type="button" value="False"/>			
Restricted TCN	<input type="button" value="False"/>	Forward BPDU	<input type="button" value="Disabled"/>					

Port	External Cost	Edge	P2P	Port STP	Restricted Role	Restricted TCN	Forward BPDU	Hello Time
1	Auto/200000	False/No	Auto/Yes	Enabled	False	False	Disabled	2/2
2	Auto/200000	False/No	Auto/Yes	Enabled	False	False	Disabled	2/2
3	Auto/200000	False/No	Auto/Yes	Enabled	False	False	Disabled	2/2
4	Auto/200000	False/No	Auto/Yes	Enabled	False	False	Disabled	2/2
5	Auto/200000	False/No	Auto/Yes	Enabled	False	False	Disabled	2/2
6	Auto/200000	False/No	Auto/Yes	Enabled	False	False	Disabled	2/2
7	Auto/200000	False/No	Auto/Yes	Enabled	False	False	Disabled	2/2
8	Auto/200000	False/No	Auto/Yes	Enabled	False	False	Disabled	2/2
9	Auto/200000	False/No	Auto/Yes	Enabled	False	False	Disabled	2/2
10	Auto/200000	False/No	Auto/Yes	Enabled	False	False	Disabled	2/2
11	Auto/200000	False/No	Auto/Yes	Enabled	False	False	Disabled	2/2

**Port field:**  
M = Trunk Master; T = Trunk Member  
**External Cost, Edge, P2P and Hello Time fields:**  
Value1/Value2 (Value1 = Configured value; Value2 = Actual value)

**Figure 4-37 STP Port Settings window**

It is advisable to define an STP Group to correspond to a VLAN group of ports.

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the starting and ending ports to be configured.
<b>External Cost (0 = Auto)</b>	This defines a metric that indicates the relative cost of forwarding packets to the specified port list. Port cost can be set automatically or as a metric value. The default value is <i>0</i> (auto). Setting <i>0</i> for the external cost will automatically set the speed for forwarding packets to the specified port(s) in the list for optimal efficiency. The default port cost for a 100Mbps port is <i>200000</i> and the default port cost for a Gigabit port is <i>20000</i> . Enter a value between <i>1</i> and <i>200000000</i> to determine the External Cost. The lower the number, the greater the probability the port will be chosen to forward packets.
<b>P2P</b>	Choosing the <i>True</i> parameter indicates a point-to-point (P2P) shared link. P2P ports are similar to edge ports; however they are restricted in that a P2P port must operate in full duplex. Like edge ports, P2P ports transition to a forwarding state rapidly thus benefiting from RSTP. A P2P value of <i>False</i> indicates that the port cannot have P2P status. <i>Auto</i> allows the port to have P2P status whenever possible and operate as if the P2P status were <i>True</i> . If the port cannot maintain this status, (for example if the port is forced to half-duplex operation) the P2P status changes to operate as if the P2P value were <i>False</i> . The default setting for this parameter is <i>Auto</i> .
<b>Restricted TCN</b>	Topology Change Notification is a simple BPDU that a bridge sends out to its root port to signal a topology change. Restricted TCN can be toggled between <i>True</i> and <i>False</i> . If set to <i>True</i> , this stops the port from propagating received topology change notifications and topology changes to other ports. The default is <i>False</i> .
<b>Migrate</b>	When operating in RSTP mode, selecting <i>Yes</i> forces the port that has been selected to transmit RSTP BPDUs.
<b>Port STP</b>	This drop-down menu allows you to enable or disable STP for the selected group of ports. The default is <i>Enabled</i> .
<b>Forward BPDU</b>	Use the drop-down menu to enable or disable the flooding of BPDU packets when STP is disabled.
<b>Edge</b>	Choosing the <i>True</i> parameter designates the port as an edge port. Edge ports cannot create loops, however an edge port can lose edge port status if a topology change creates a potential for a loop. An edge port normally should not receive BPDU packets. If a BPDU packet is received, it automatically loses edge port status. Choosing the <i>False</i> parameter indicates that the port does not have edge port status. Alternatively, the <i>Auto</i> option is available.
<b>Restricted Role</b>	Use the drop-down menu to toggle Restricted Role between <i>True</i> and <i>False</i> . If set to <i>True</i> , the port will never be selected to be the Root port. The default is <i>False</i> .

Click the **Apply** button to accept the changes made.

## MST Configuration Identification

This window allows the user to configure a MSTI instance on the Switch. These settings will uniquely identify a multiple spanning tree instance set on the Switch. The Switch initially possesses one CIST, or Common Internal Spanning Tree, of which the user may modify the parameters for but cannot change the MSTI ID for, and cannot be deleted.

To view the following window, click **L2 Features > Spanning Tree > MST Configuration Identification**, as show below:

The screenshot shows the 'MST Configuration Identification' window. It includes sections for 'MST Configuration Identification Settings' (Configuration Name: 00:01:02:03:04:00, Revision Level: 0), 'Instance ID Settings' (MSTI ID: 1-64, Type: Add VID, VID List: 2-5, 10), and a table of total entries (1). The table lists MSTI ID (1-4094) and VID List (1-4094) with 'Edit' and 'Delete' buttons.

Total Entries: 1	
MSTI ID	VID List
CIST	1-4094

Figure 4-38 MST Configuration Identification window

The fields that can be configured are described below:

Parameter	Description
<b>Configuration Name</b>	This name uniquely identifies the MSTI (Multiple Spanning Tree Instance). If a Configuration Name is not set, this field will show the MAC address to the device running MSTP.
<b>Revision Level (0-65535)</b>	This value, along with the Configuration Name, identifies the MSTP region configured on the Switch.
<b>MSTI ID (1-64)</b>	Enter a number between 1 and 64 to set a new MSTI on the Switch.
<b>Type</b>	This field allows the user to choose a desired method for altering the MSTI settings. The user has two choices: <i>Add VID</i> - Select this parameter to add VIDs to the MSTI ID, in conjunction with the VID List parameter. <i>Remove VID</i> - Select this parameter to remove VIDs from the MSTI ID, in conjunction with the VID List parameter.
<b>VID List (e.g.: 2-5, 10)</b>	This field is used to specify the VID range from configured VLANs set on the Switch. Supported VIDs on the Switch range from ID number 1 to 4094.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## STP Instance Settings

This window displays MSTIs currently set on the Switch and allows users to change the Priority of the MSTIs. To view the following window, click **L2 Features > Spanning Tree > STP Instance Settings**, as shown below:

The screenshot shows the 'STP Instance Settings' window. At the top, there's a section for 'STP Priority Settings' with fields for 'MSTI ID' (dropdown), 'Priority' (dropdown set to 0), and an 'Apply' button. Below this is a table titled 'Total Entries: 1' with one row for 'CIST' (Instance Type), 'Disabled' (Instance Status), and '32768 (Bridge Priority: 32768, SYS ID Ext: 0)' (Instance Priority). There are 'Edit' and 'View' buttons next to it. The bottom section is titled 'STP Instance Operational Status' and lists various parameters like MSTP ID, External Root Cost, Internal Root Cost, Root Port, Forward Delay, and Last Topology Change, all currently set to '--'.

Figure 4-39STP Instance Settings window

The fields that can be configured are described below:

Parameter	Description
<b>MSTI ID</b>	Enter the MSTI ID in this field. An entry of 0 denotes the CIST (default MSTI).
<b>Priority</b>	Enter the priority in this field. The available range of values is from 0 to 61440.

Click the **Apply** button to accept the changes made.

Click the **Edit** button to re-configure the specific entry.

Click the **View** button to display the information of the specific entry.

## MSTP Port Information

This window displays the current MSTI configuration information and can be used to update the port configuration for an MSTI ID. If a loop occurs, the MSTP function will use the port priority to select an interface to put into the forwarding state. Set a higher priority value for interfaces to be selected for forwarding first. In instances where the priority value is identical, the MSTP function will implement the lowest MAC address into the forwarding state and other interfaces will be blocked. Remember that lower priority values mean higher priorities for forwarding packets.

To view the following window, click **L2 Features > Spanning Tree > MSTP Port Information**, as show below:

The screenshot shows the 'MSTP Port Information' window. At the top, there are dropdown menus for 'Unit' (1) and 'Port' (01), and a 'Find' button. Below this is a section for 'MSTP Port Settings' with fields for 'Instance ID' (dropdown), 'Internal Path Cost (1-2000000000)' (dropdown), 'Auto' (checkbox checked), 'Priority' (dropdown set to 0), and an 'Apply' button. The bottom section is titled 'Port 1:1 Settings' and contains a table with one row for MSTI 0, showing Designated Bridge as N/A, Internal Path Cost as 200000, Priority as 128, Status as Disabled, and Role as Disabled. There is an 'Edit' button next to the row.

Figure 4-40 MSTP Port Information window

To view the MSTI settings for a particular port, use the drop-down menu to select the Port number. To modify the settings for a particular MSTI instance, enter a value in the Instance ID field, an Internal Path Cost, and use the drop-down menu to select a Priority.

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Select the port you want to configure.
<b>Instance ID</b>	The MSTI ID of the instance to be configured. Enter a value between 0 and 64. An entry of 0 in this field denotes the CIST (default MSTI).
<b>Internal Path Cost (1-200000000)</b>	This parameter is set to represent the relative cost of forwarding packets to specified ports when an interface is selected within an STP instance. Selecting this parameter with a value in the range of 1 to 200000000 will set the quickest route when a loop occurs. A lower Internal cost represents a quicker transmission. Selecting 0 (zero) for this parameter will set the quickest route automatically and optimally for an interface. Tick the <b>Auto</b> option to allow the system to assign a value here.
<b>Priority</b>	Enter a value between 0 and 240 to set the priority for the port interface. A higher priority will designate the interface to forward packets first. A lower number denotes a higher priority.

Click the **Find** button to locate a specific entry based on the information entered.

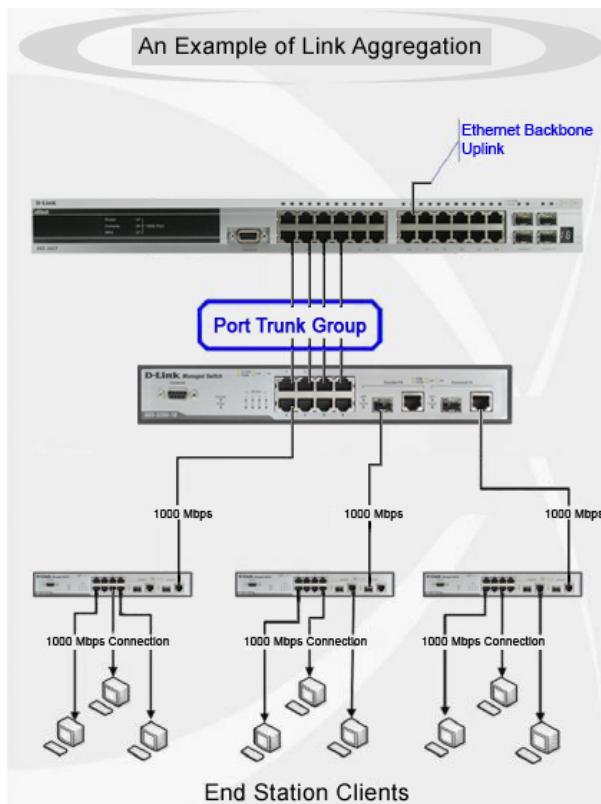

Click the **Apply** button to accept the changes made.

Click the **Edit** button to re-configure the specific entry.

## Link Aggregation

### Understanding Port Trunk Groups

Port trunk groups are used to combine a number of ports together to make a single high-bandwidth data pipeline. The Switch supports up to 32 port trunk groups with two to eight ports in each group.

#### 4-41 Example of Port Trunk Group

The Switch treats all ports in a trunk group as a single port. Data transmitted to a specific host (destination address) will always be transmitted over the same port in a trunk group. This allows packets in a data stream to arrive in the same order they were sent.

Link aggregation allows several ports to be grouped together and to act as a single link. This gives a bandwidth that is a multiple of a single link's bandwidth.

Link aggregation is most commonly used to link a bandwidth intensive network device or devices, such as a server, to the backbone of a network.

The Switch allows the creation of up to 32 link aggregation groups, each group consisting of 2 to 8 links (ports). Each port can only belong to a single link aggregation group.

All of the ports in the group must be members of the same VLAN, and their STP status, static multicast, traffic control; traffic segmentation and 802.1p default priority configurations must be identical. Port locking and 802.1X must not be enabled on the trunk group. Further, the LACP aggregated links must all be of the same speed and should be configured as full duplex.

The Master Port of the group is to be configured by the user, and all configuration options, including the VLAN configuration that can be applied to the Master Port, are applied to the entire link aggregation group.

Load balancing is automatically applied to the ports in the aggregated group, and a link failure within the group causes the network traffic to be directed to the remaining links in the group.

The Spanning Tree Protocol will treat a link aggregation group as a single link, on the switch level. On the port level, the STP will use the port parameters of the Master Port in the calculation of port cost and in determining the state of the link aggregation group. If two redundant link aggregation groups are configured on the Switch, STP will block one entire group; in the same way STP will block a single port that has a redundant link.

**NOTE:** If any ports within the trunk group become disconnected, packets intended for the disconnected port will be load shared among the other linked ports of the link aggregation group.

## Port Trunking Settings

On this page the user can configure the port trunk settings for the switch.

To view the following window, click **L2 Features > Link Aggregation > Port Trunking Settings**, as show below:

The Port Trunking Settings window displays the following interface:

- Algorithm:** MAC Source
- Total Entries: 0**
- Table Headers:** Group ID, Type, Master Port, Member Ports, Active Ports, Status, Flooding Port, Trap
- Edit Trunking Information:**
  - Unit: 1, Group ID (1-32): [ ]
  - Type: Static, Master Port: 1, 01, State: Disabled, Trap: Disabled
  - Buttons: Clear All, Add
  - Ports: A grid of 26 ports (01-26) with checkboxes below them.
- Note:** Maximum 8 ports in a static trunk or LACP group.

Figure 4-42 Port Trunking Settings window

The fields that can be configured or displayed are described below:

Parameter	Description
<b>Algorithm</b>	This is the traffic hash algorithm among the ports of the link aggregation group. Options to choose from are MAC Source Dest, IP Source Dest and Lay4 Source Dest.
<b>Unit</b>	Select the unit you wish to configure.
<b>Group ID (1-32)</b>	Select an ID number for the group, between 1 and 32.
<b>Type</b>	This drop-down menu allows users to select between <i>Static</i> and <i>LACP</i> (Link Aggregation Control Protocol). <i>LACP</i> allows for the automatic detection of links in a Port Trunking Group.
<b>Master Port</b>	Choose the Master Port for the trunk group using the drop-down menu.
<b>State</b>	Use the drop-down menu to toggle between <i>Enabled</i> and <i>Disabled</i> . This is used to turn a port trunking group on or off. This is useful for diagnostics, to quickly isolate a bandwidth intensive network device or to have an absolute backup aggregation group that is not under automatic control.
<b>Member Ports</b>	Choose the members of a trunked group. Up to eight ports can be assigned to a group.
<b>Active Ports</b>	Shows the ports that are currently forwarding packets.

Click the **Apply** button to accept the changes made.

Click the **Clear All** button to clear out all the information entered.

Click the **Add** button to add a new entry based on the information entered.

**NOTE:** The maximum number of ports that can be configured in one Static Trunk or LACP Group are **8 ports**.

## LACP Port Settings

In conjunction with the Trunking window, users can create port trunking groups on the Switch. Using the following window, the user may set which ports will be active and passive in processing and sending LACP control frames.

To view the following window, click **L2 Features > Link Aggregation > LACP Port Settings**, as show below:

The screenshot shows the 'LACP Port Settings' window. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), 'To Port' (set to 01), and 'Activity' (set to Passive). A large 'Apply' button is located at the bottom right. Below these controls is a table titled 'Unit 1 Settings' with 9 rows, each representing a port from 1 to 9. The 'Activity' column for all ports is set to 'Passive'.

Port	Activity
1	Passive
2	Passive
3	Passive
4	Passive
5	Passive
6	Passive
7	Passive
8	Passive
9	Passive

Figure 4-43 LACP Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	A consecutive group of ports may be configured starting with the selected port.
<b>Activity</b>	<p><b>Active</b> - Active LACP ports are capable of processing and sending LACP control frames. This allows LACP compliant devices to negotiate the aggregated link so the group may be changed dynamically as needs require. In order to utilize the ability to change an aggregated port group, that is, to add or subtract ports from the group, at least one of the participating devices must designate LACP ports as active. Both devices must support LACP.</p> <p><b>Passive</b> - LACP ports that are designated as passive cannot initially send LACP control frames. In order to allow the linked port group to negotiate adjustments and make changes dynamically, one end of the connection must have "active" LACP ports (see above).</p>

Click the **Apply** button to accept the changes made.

## FDB

### Static FDB Settings

#### Unicast Static FDB Settings

This window is used to configure the static unicast forwarding on the Switch.

To view the following window, click **L2 Features > FDB > Static FDB Settings > Unicast Static FDB Settings**, as shown below:

The screenshot shows the 'Unicast Static FDB Settings' window. At the top, there are two radio button options: 'VLAN Name' (selected) and 'VLAN List'. Below these are input fields for 'MAC Address' (00-00-00-00-00-00) and 'Port' (set to 'Port'). An 'Apply' button is located to the right. A table below displays one entry: VID 1, VLAN Name default, MAC Address 00-11-22-33-44-55, and Port 2. To the right of the table are buttons for 'Delete', '1/1', '1', and 'Go'. The total entries count is 1.

Figure 4-44 Unicast Static FDB Settings window

The fields that can be configured are described below:

Parameter	Description
VLAN Name	Click the radio button and enter the VLAN name of the VLAN on which the associated unicast MAC address resides.
VLAN List	Click the radio button and enter a list of VLAN on which the associated unicast MAC address resides.
MAC Address	The MAC address to which packets will be statically forwarded. This must be a unicast MAC address.
Port/Drop	Allows the selection of the port number on which the MAC address entered above resides. This option could also drop the MAC address from the unicast static FDB. When selecting <i>Port</i> , enter the port number in the field. The format can be "unit ID:port number" (e.g. 1:5) or "port number" (e.g. 5). When only entering port number, the default unit ID is 1.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry.

## Multicast Static FDB Settings

Users can set up static multicast forwarding on the Switch.

To view the following window, click **L2 Features > FDB > Static FDB Settings > Multicast Static FDB Settings**, as show below:

The screenshot shows the 'Multicast Static FDB Settings' window. It includes fields for 'VID' (VID), 'Multicast MAC Address' (MAC Address), and 'Unit' (Unit ID). Below these are two rows of buttons for 'Port' selection: 'None' (All selected) and 'Egress' (All selected). To the right are 'Clear All' and 'Apply' buttons. A table titled 'Egress Ports' lists ports 01 to 26, with checkboxes for each. At the bottom, a summary table shows 'Total Entries: 0' and columns for 'VID', 'MAC Address', 'Mode', and 'Egress Ports'.

Figure 4-45 Multicast Static FDB Settings window

The fields that can be configured are described below:

Parameter	Description
<b>VID</b>	The VLAN ID of the VLAN the corresponding MAC address belongs to.
<b>Multicast MAC Address</b>	The static destination MAC address of the multicast packets. This must be a multicast MAC address. The format of the destination MAC address is 01-xx-xx-xx-xx-xx, but 01-00-5E-xx-xx-xx should be excluded. The function does not support the destination MAC address with 01-00-5E-xx-xx-xx.
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Allows the selection of ports that will be members of the static multicast group and ports that are either forbidden from joining dynamically, or that can join the multicast group dynamically, using GMRP. The options are: <i>None</i> - No restrictions on the port dynamically joining the multicast group. When <i>None</i> is chosen, the port will not be a member of the Static Multicast Group. Click the <b>All</b> button to select all the ports. <i>Egress</i> - The port is a static member of the multicast group. Click the <b>All</b> button to select all the ports.

Click the **Clear All** button to clear out all the information entered.

Click the **Apply** button to accept the changes made.

## MAC Notification Settings

MAC Notification is used to monitor MAC addresses learned and entered into the forwarding database. This window allows you to globally set MAC notification on the Switch. Users can set MAC notification for individual ports on the Switch.

To view the following window, click **L2 Features > FDB > MAC Notification Settings**, as show below:

The screenshot shows the 'MAC Notification Settings' window with the following sections:

- MAC Notification Global Settings:**
  - State: Enabled (radio button selected)
  - Interval (1-2147483647): 1 sec
  - History Size (1-500): 50
  - Buttons: Apply, Safeguard
- MAC Notification Port Settings:**

Unit	From Port	To Port	State
1	01	01	Disabled
- Unit 1 Settings:**

Port	MAC Address Notification State
01	Disabled
02	Disabled
03	Disabled
04	Disabled
05	Disabled
06	Disabled
07	Disabled
08	Disabled
09	Disabled

Figure 4-46 MAC Notification Settings window

The fields that can be configured are described below:

Parameter	Description
<b>State</b>	Enable or disable MAC notification globally on the Switch
<b>Interval (1-2147483647)</b>	The time in seconds between notifications. Value range to use is 1 to 2147483647.
<b>History Size (1-500)</b>	The maximum number of entries listed in the history log used for notification. Up to 500 entries can be specified.
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the starting and ending ports for MAC notification.
<b>State</b>	Enable MAC Notification for the ports selected using the drop-down menu.

Click the **Apply** button to accept the changes made for each individual section.

## MAC Address Aging Time Settings

Users can configure the MAC Address aging time on the Switch.

To view the following window, click **L2 Features > FDB > MAC Address Aging Time Settings**, as show below:

Figure 4-47 MAC Address Aging Time Settings window

The fields that can be configured are described below:

Parameter	Description
<b>MAC Address Aging Time (10-1000000)</b>	This field specify the length of time a learned MAC Address will remain in the forwarding table without being accessed (that is, how long a learned MAC Address is allowed to remain idle). To change this option, type in a different value representing the MAC address' age-out time in seconds. The MAC Address Aging Time can be set to any value between 10 and 1000000 seconds. The default setting is 300 seconds.

Click the **Apply** button to accept the changes made.

## MAC Address Table

This allows the Switch's MAC address forwarding table to be viewed. When the Switch learns an association between a MAC address, VLAN and a port number, it makes an entry into its forwarding table. These entries are then used to forward packets through the Switch.

To view the following window, click **L2 Features > FDB > MAC Address Table**, as show below:

The MAC Address Table window allows users to search for specific entries or view all existing entries. It includes fields for Unit (1), Port (01), VLAN Name, VID List, MAC Address, and Security. Buttons for Find, Clear Dynamic Entries, View All Entries, and Clear All Entries are available. The table displays 3 total entries, each with columns for VID, VLAN Name, MAC Address, Port, Type, and Status, along with an 'Add to Static MAC table' button.

VID	VLAN Name	MAC Address	Port	Type	Status	
1	default	00-01-02-03-04-00	CPU	Self	Forward	<a href="#">Add to Static MAC table</a>
1	default	00-23-7D-BC-08-44	1:21	Dynamic	Forward	<a href="#">Add to Static MAC table</a>
1	default	00-23-7D-BC-2E-18	1:21	Dynamic	Forward	<a href="#">Add to Static MAC table</a>

1/1 1 Go

Figure 4-48 MAC Address Table window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	The port to which the MAC address below corresponds.
<b>VLAN Name</b>	Enter a VLAN Name for the forwarding table to be browsed by.
<b>VID List</b>	Enter a VID list of VLAN for the forwarding table to be browsed by.
<b>MAC Address</b>	Enter a MAC address for the forwarding table to be browsed by.
<b>Security</b>	Tick the check box to display the FDB entries that are created by the security module.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Clear Dynamic Entries** button to delete all dynamic entries of the address table.

Click the **View All Entries** button to display all the existing entries.

Click the **Clear All Entries** button to remove all the entries listed in the table.

Click the **Add to Static MAC table** button to add the specific entry to the Static MAC table.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## ARP & FDB Table

On this page the user can find the ARP and FDB table parameters.

To view the following window, click **L2 Features > FDB > ARP & FDB Table**, as show below:

ARP & FDB Table					Safeguard
Unit	1	Port	01		<input type="button" value="Find by Port"/>
MAC Address	00-00-00-00-00-00				<input type="button" value="Find by MAC"/>
IP Address					<input type="button" value="Find by IP Address"/>
					<input type="button" value="View All Entries"/>
<b>Total Entries: 1</b>					
Interface	IP Address	MAC Address	VLAN Name	Port	
System	192.168.69.66	00-23-7D-BC-2E-18	default	1:21	<input type="button" value="Add to IP MAC Port Binding Table"/>

Figure 4-49 ARP &amp; FDB Table window

The fields that can be configured are described below:

Parameter	Description
Unit	Select the unit you wish to configure.
Port	Select the port number to use for this configuration.
MAC Address	Enter the MAC address to use for this configuration.
IP Address	Enter the IP address the use for this configuration.

Click the **Find by Port** button to locate a specific entry based on the port number selected.

Click the **Find by MAC** button to locate a specific entry based on the MAC address entered.

Click the **Find by IP Address** button to locate a specific entry based on the IP address entered.

Click the **View All Entries** button to display all the existing entries.

Click the **Add to IP MAC Port Binding Table** to add the specific entry to the IMPB Entry Settings window.

## L2 Multicast Control

### IGMP Proxy

Based on IGMP forwarding, the IGMP proxy runs the host part of IGMP on the upstream and router part of IGMP on the downstream, and replicates multicast traffic across VLANs on devices such as the edge boxes. It reduces the number of the IGMP control packets transmitted to the core network.

### IGMP Proxy Settings

This window is used to configure the IGMP proxy state and IGMP proxy upstream interface in this page.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Proxy > IGMP Proxy Settings**, as show below:

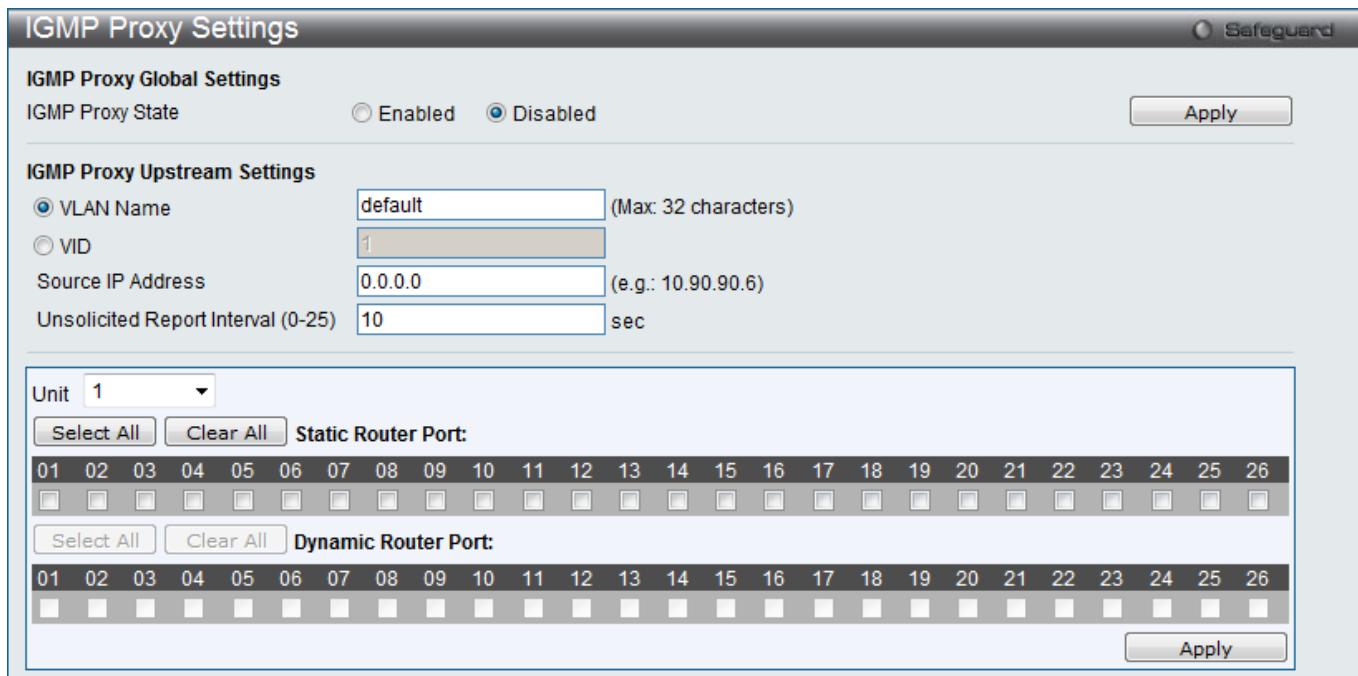

Figure 4-50 IGMP Proxy Settings window

The fields that can be configured are described below:

Parameter	Description
<b>IGMP Proxy State</b>	Use the radio buttons to enable or disable the IGMP Proxy Global State.
<b>VLAN Name</b>	Click the radio button and enter the VLAN name for the interface.
<b>VID</b>	Click the radio button and enter the VLAN ID for the interface.
<b>Source IP Address</b>	Enter the source IP address of the upstream protocol packet. If it is not specified, zero IP address will be used as the protocol source IP address.
<b>Unsolicited Report Interval (0-25)</b>	The Unsolicited report interval. It is the time between repetitions of the host's initial report of membership in a group. Default is 10 seconds. If set to 0, it means to send only one report packet.
<b>Unit</b>	Select the unit you wish to configure.
<b>Static Router Port</b>	Select the port that will be included in this configuration.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Select All** button to select all the ports for configuration.

Click the **Clear All** button to unselect all the ports for configuration.

## IGMP Proxy Downstream Settings

This window is used to configure the IGMP proxy downstream interface in this page. The IGMP proxy downstream interface must be an IGMP snooping enabled VLAN.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Proxy > IGMP Proxy Downstream Settings**, as show below:

The window title is "IGMP Proxy Downstream Settings". It contains fields for "VLAN Name" (radio button selected), "VID List" (radio button unselected), "Downstream Action" (dropdown menu set to "Add"), and a "Downstream VID List" input field with placeholder "(e.g.: 1-3, 5)". A "Safeguard" button is in the top right corner, and an "Apply" button is at the bottom right.

Figure 4-51 IGMP Proxy Downstream Settings window

The fields that can be configured are described below:

Parameter	Description
<b>VLAN Name</b>	Enter the VLAN Name which belongs to the IGMP proxy downstream interface.
<b>VID List</b>	Enter a list of VLANs which belong to the IGMP proxy downstream interface.
<b>Downstream Action</b>	Use the drop-down menu to add or delete a downstream interface.

Click the **Apply** button to accept the changes made.

## IGMP Proxy Group

This window displays the IGMP Proxy Group settings.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Proxy > IGMP Proxy Group**, as shown below:

The table has a header row: "Total Entries: 128", "Group NO.", "Destination IP Address", "Source IP Address", and "Member Ports". The "Member Ports" column contains 128 entries, each labeled "Member Ports".

Total Entries: 128			
Group NO.	Destination IP Address	Source IP Address	Member Ports
1	239.0.0.1	NULL	Member Ports
2	239.0.0.2	NULL	Member Ports
3	239.0.0.3	NULL	Member Ports
4	239.0.0.4	NULL	Member Ports
5	239.0.0.5	NULL	Member Ports
6	239.0.0.6	NULL	Member Ports
7	239.0.0.7	NULL	Member Ports
8	239.0.0.8	NULL	Member Ports
9	239.0.0.9	NULL	Member Ports
10	239.0.0.10	NULL	Member Ports
11	239.0.0.11	NULL	Member Ports
12	239.0.0.12	NULL	Member Ports
13	239.0.0.13	NULL	Member Ports
14	239.0.0.14	NULL	Member Ports
15	239.0.0.15	NULL	Member Ports
16	239.0.0.16	NULL	Member Ports
17	239.0.0.17	NULL	Member Ports
18	239.0.0.18	NULL	Member Ports
19	239.0.0.19	NULL	Member Ports
20	239.0.0.20	NULL	Member Ports
21	239.0.0.21	NULL	Member Ports
22	239.0.0.22	NULL	Member Ports
23	239.0.0.23	NULL	Member Ports
24	239.0.0.24	NULL	Member Ports
25	239.0.0.25	NULL	Member Ports
26	239.0.0.26	NULL	Member Ports
27	239.0.0.27	NULL	Member Ports
28	239.0.0.28	NULL	Member Ports
29	239.0.0.29	NULL	Member Ports
30	239.0.0.30	NULL	Member Ports
31	239.0.0.31	NULL	Member Ports
32	239.0.0.32	NULL	Member Ports
33	239.0.0.33	NULL	Member Ports
34	239.0.0.34	NULL	Member Ports
35	239.0.0.35	NULL	Member Ports
36	239.0.0.36	NULL	Member Ports

**Figure 4-52 IGMP Proxy Group window**

Click the [Member Ports](#) link to view the IGMP proxy member port information.

After clicking the [Member Ports](#) option, the following window will appear.

IGMP Proxy Group			Safeguard
			<< Back
			Total Entries: 1
VID	Port List	Status	
100	1:24	Active	

**Figure 4-53 IGMP Proxy Group – Member Ports window**

## IGMP Snooping

Internet Group Management Protocol (IGMP) snooping allows the Switch to recognize IGMP queries and reports sent between network stations or devices and an IGMP host. When enabled for IGMP snooping, the Switch can open or close a port to a specific device based on IGMP messages passing through the Switch.

### IGMP Snooping Settings

In order to use IGMP Snooping it must first be enabled for the entire Switch under IGMP Global Settings at the top of the window. You may then fine-tune the settings for each VLAN by clicking the corresponding **Edit** button. When enabled for IGMP snooping, the Switch can open or close a port to a specific multicast group member based on IGMP messages sent from the device to the IGMP host or vice versa. The Switch monitors IGMP messages and discontinues forwarding multicast packets when there are no longer hosts requesting that they continue.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Snooping > IGMP Snooping Settings**, as show below:

IGMP Snooping Settings			Safeguard
<b>IGMP Snooping Global Settings</b>			
IGMP Snooping State	<input type="radio"/> Enabled	<input checked="" type="radio"/> Disabled	<b>Apply</b>
<hr/>			
<b>IGMP Data Driven Learning Settings</b>			
Max Learned Entry Value (1-960)	120		<b>Apply</b>
<hr/>			
<b>Total Entries: 2</b>			
VID	VLAN Name	State	
1	default	Disabled	<a href="#">Modify Router Port</a> <b>Edit</b>
2	PVLAN	Disabled	<a href="#">Modify Router Port</a> <b>Edit</b>
1 / 1   1 <input type="button" value="Go"/>			

**Figure 4-54 IGMP Snooping Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>IGMP Snooping State</b>	Use the radio buttons to enable or disable the IGMP Snooping state.
<b>Max Learned Entry Value</b>	Enter the maximum number of groups that can be learned by data driven feature here. This value must be between 1 and 960.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Edit** button to configure the IGMP Snooping Parameters Settings.

Click the [Modify Router Port](#) link to configure the IGMP Snooping Router Port Settings.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

After clicking the **Edit** button, the following page will appear:

IGMP Snooping Parameters Settings			
VID	1	VLAN Name	default
Rate Limit	No Limitation	Querier IP	0.0.0.0
Querier Expiry Time	0 sec	Query Interval (1-65535)	125 sec
Max Response Time (1-25)	10 sec	Robustness Value (1-7)	2
Last Member Query Interval (1-25)	1 sec	Data Driven Group Expiry Time (1-65535)	260 sec
Proxy Reporting Source IP	0.0.0.0 (e.g.: 10.90.90.90)	Proxy Reporting State	Disabled
Querier State	Disabled	Fast Leave	Disabled
State	Disabled	Data Driven Learning State	Enabled
Data Driven Learning Aged Out	Disabled	Version	3
Querier Role	Non-Querier		
<input type="button" value="&lt;&lt;Back"/> <input type="button" value="Apply"/>			

**Figure 4-55 IGMP Snooping Parameters Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Query Interval (1-65535)</b>	Specify the amount of time in seconds between general query transmissions. The default setting is 125 seconds..
<b>Max Response Time (1-25)</b>	Specify the maximum time in seconds to wait for reports from members. The default setting is 10 seconds.
<b>Robustness Value (1-7)</b>	Provides fine-tuning to allow for expected packet loss on a subnet. The value of the robustness value is used in calculating the following IGMP message intervals: By default, the robustness variable is set to 2.
<b>Last Member Query Interval (1-25)</b>	Specify the maximum amount of time between group-specific query messages, including those sent in response to leave-group messages. You might lower this interval to reduce the amount of time it takes a router to detect the loss of the last member of a group.
<b>Data Driven Group Expiry Time</b>	Specifies the data driven group lifetime value used. This value is only applicable if the aged out option is enabled.
<b>Proxy Reporting Source IP</b>	Enter the proxy reporting source IP address.
<b>Proxy Reporting State</b>	Use the drop-down menu to enable and disable the proxy report state.
<b>Querier State</b>	If this state is enable, it allows the Switch to be selected as an IGMP Querier that sends IGMP query packets. If this state is disabled, then the Switch will not play the role as a Querier.
<b>Fast Leave</b>	Enable or disable the IGMP snooping fast leave function. If enabled, the membership is immediately removed when the system receive the IGMP leave message.
<b>State</b>	Used to enable or disable IGMP snooping for the specified VLAN. This option is disabled by default. <b>Note:</b> If the Layer 3 router connected to the switch provides only the IGMP proxy

	function but does not provide the multicast routing function, then this state must be configured as disabled. Otherwise, if the Layer 3 router is not selected as the querier, it will not send the IGMP query packet. Since it will not also send the multicast-routing protocol packet, the port will be timed out as a router port.
<b>Data Driven Learning State</b>	Specifies to enable or disable the data driven learning of an IGMP snooping group. When data-driven learning is enabled for a VLAN, when the switch receives IP multicast traffic on this VLAN, an IGMP snooping group will be created. The learning of an entry is not activated by an IGMP membership registration, but activated by traffic. For an ordinary IGMP snooping entry, the IGMP protocol will take care of the aging out of the entry. For a data-driven entry, the entry can be specified not to age out by the aged timer. When data driven learning is enabled and the data driven table is not full, the multicast filtering mode for all ports will be ignored. The multicast packets will be forwarded to router ports. If the data driven learning table is full, multicast packets will be forwarded according to the multicast filtering mode. <b>Note</b> that if a data-driven group is created and IGMP member ports are learned later on, the entry will become an ordinary IGMP snooping entry. The aging out mechanism will follow the ordinary IGMP snooping entry.
<b>Data Driven Learning Aged Out</b>	Specifies that the aging out of the entry will be enabled or disabled.
<b>Version</b>	Specify the version of IGMP packet that will be sent by this port. If an IGMP packet received by the interface has a version higher than the specified version, this packet will be forwarded from the router ports or VLAN flooding.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

After clicking the [Modify Router Port](#) link, the following page will appear:

IGMP Snooping Router Port Settings

VID: 1 VLAN Name: default

Unit: 1

**Static Router Port:**

Figure 4-56 IGMP Snooping Router Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Static Router Port</b>	This section is used to designate a range of ports as being connected to multicast-

	enabled routers. This will ensure that all packets with such a router as its destination will reach the multicast-enabled router regardless of the protocol.
<b>Forbidden Router Port</b>	This section is used to designate a range of ports as being not connected to multicast-enabled routers. This ensures that the forbidden router port will not propagate routing packets out.
<b>Dynamic Router Port</b>	Displays router ports that have been dynamically configured.

Click the **Select All** button to select all the ports for configuration.

Click the **Clear All** button to unselect all the ports for configuration.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

## IGMP Snooping Rate Limit Settings

On this page the user can configure the IGMP snooping rate limit parameters.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Snooping > IGMP Snooping Rate Limit Settings**, as show below:

Total Entries: 2	
VID	Rate Limit
1	No Limit
2	No Limit

Figure 4-57 IGMP Snooping Rate Limit Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Port List</b>	Enter the port list used for this configuration.
<b>VID List</b>	Enter the VID list used for this configuration.
<b>Rate Limit (1-1000)</b>	Enter the IGMP snooping rate limit used. By selecting the <b>No Limit</b> check box, the rate limit for the entered port(s) will be ignored.

Click the **Apply** button to accept the changes made.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Edit** button to re-configure the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## IGMP Snooping Static Group Settings

Users can view the Switch's IGMP Snooping Group Table. IGMP Snooping allows the Switch to read the Multicast Group IP address and the corresponding MAC address from IGMP packets that pass through the Switch.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Snooping > IGMP Snooping Static Group Settings**, as show below:

The screenshot shows the 'IGMP Snooping Static Group Settings' window. At the top, there are three configuration options: 'VLAN Name' (radio button selected), 'VID List' (radio button unselected), and 'IPv4 Address' (radio button unselected). Below these are input fields: 'VLAN Name' (Max: 32 characters), 'VID List' (e.g.: 1-3, 5), and 'IPv4 Address' (e.g.: 224.1.1.1). To the right of these fields are 'Find', 'Create', and 'Delete' buttons. Further down are 'View All' and 'Edit' buttons. A table below displays 'Total Entries: 1'. The table has columns: VID, VLAN Name, IP Address, and Static Member Port. One entry is listed: VID 1, VLAN Name default, IP Address 224.1.1.1. To the right of the table are 'Edit' and 'Delete' buttons. At the bottom right are page navigation buttons: '1/1', '1', and 'Go'.

Figure 4-58 IGMP Snooping Static Group Settings window

The fields that can be configured are described below:

Parameter	Description
VLAN Name	The <i>VLAN Name</i> of the multicast group.
VID List	The <i>VID List</i> of the multicast group.
IPv4 Address	Enter the IPv4 address.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Create** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Edit** button to re-configure the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

After clicking the **Edit** button, the following page will appear:

The screenshot shows the 'IGMP Snooping Static Group Settings – Edit' window. At the top, it displays the configuration for VID 2, VLAN Name PVLAN, and IP Address 224.1.1.1. Below this is a 'Unit' dropdown set to 1. The 'Ports' section contains a grid of 26 ports (01 to 26) with checkboxes. To the right of the grid are 'Select All' and 'Clear All' buttons. At the bottom are '<< Back' and 'Apply' buttons.

Figure 4-59 IGMP Snooping Static Group Settings – Edit window

The fields that can be configured are described below:

Parameter	Description
Unit	Select the unit you wish to configure.
Ports	Select the appropriate ports individually to include them in the IGMP snooping static group settings.

Click the **Select All** button to select all the ports for configuration.

Click the **Clear All** button to unselect all the ports for configuration.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

## IGMP Router Port

Users can display which of the Switch's ports are currently configured as router ports. A router port configured by a user (using the console or Web-based management interfaces) is displayed as a static router port, designated by S. A router port that is dynamically configured by the Switch is designated by D, while a Forbidden port is designated by F.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Snooping > IGMP Router Port**, as shown below:

**Figure 4-60 IGMP Router Port window**

Enter a VID (VLAN ID) in the field at the top of the window.

Click the **Find** button to locate a specific entry based on the information entered.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

**NOTE:** The abbreviations used on this page are **Static Router Port (S)**, **Dynamic Router Port (D)** and **Forbidden Router Port (F)**.

## IGMP Snooping Group

Users can view the Switch's IGMP Snooping Group Table. IGMP Snooping allows the Switch to read the Multicast Group IP address and the corresponding MAC address from IGMP packets that pass through the Switch.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Snooping > IGMP Snooping Group**, as show below:

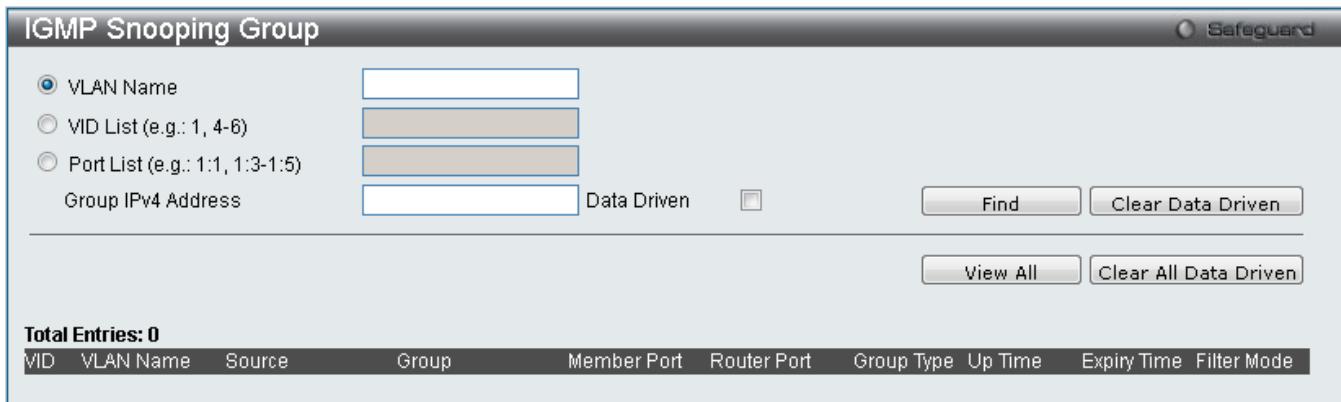

Figure 4-61 IGMP Snooping Group window

The fields that can be configured are described below:

Parameter	Description
<b>VLAN Name</b>	The VLAN Name of the multicast group.
<b>VID List</b>	The VLAN ID list of the multicast group.
<b>Port List</b>	Specify the port number(s) used to find a multicast group.
<b>Group IPv4 Address</b>	Enter the IPv4 address.
<b>Data Driven</b>	Tick this option to enable or disable the data driven learning of an IGMP snooping group.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Clear Data Driven** button to clear data driven information for the specified entry.

Click the **Clear All Data Driven** button to clear data driven information for all entries.

## IGMP Snooping Forwarding Table

This page displays the switch's current IGMP snooping forwarding table. It provides an easy way for user to check the list of ports that the multicast group comes from and specific sources that it will be forwarded to. The packet comes from the source VLAN. They will be forwarded to the forwarding VLAN. The IGMP snooping further restricts the forwarding ports.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Snooping > IGMP Snooping Forwarding Table**, as show below:

Figure 4-62 IGMP Snooping Forwarding Table window

The fields that can be configured are described below:

Parameter	Description
<b>VLAN Name</b>	The VLAN Name of the multicast group.

<b>VID List</b>	The VLAN ID list of the multicast group.
-----------------	--

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

## IGMP Snooping Counter

Users can view the switch's IGMP Snooping counter table.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Snooping > IGMP Snooping Counter**, as show below:

Figure 4-63 IGMP Snooping Counter window

The fields that can be configured are described below:

Parameter	Description
<b>VLAN Name</b>	The VLAN Name of the multicast group.
<b>VID List</b>	The VLAN ID list of the multicast group.
<b>Port List</b>	The <i>Port List</i> of the multicast group.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the [Packet Statistics](#) link to view the IGMP Snooping Counter Table.

After clicking the [Packet Statistics](#) link, the following page will appear:

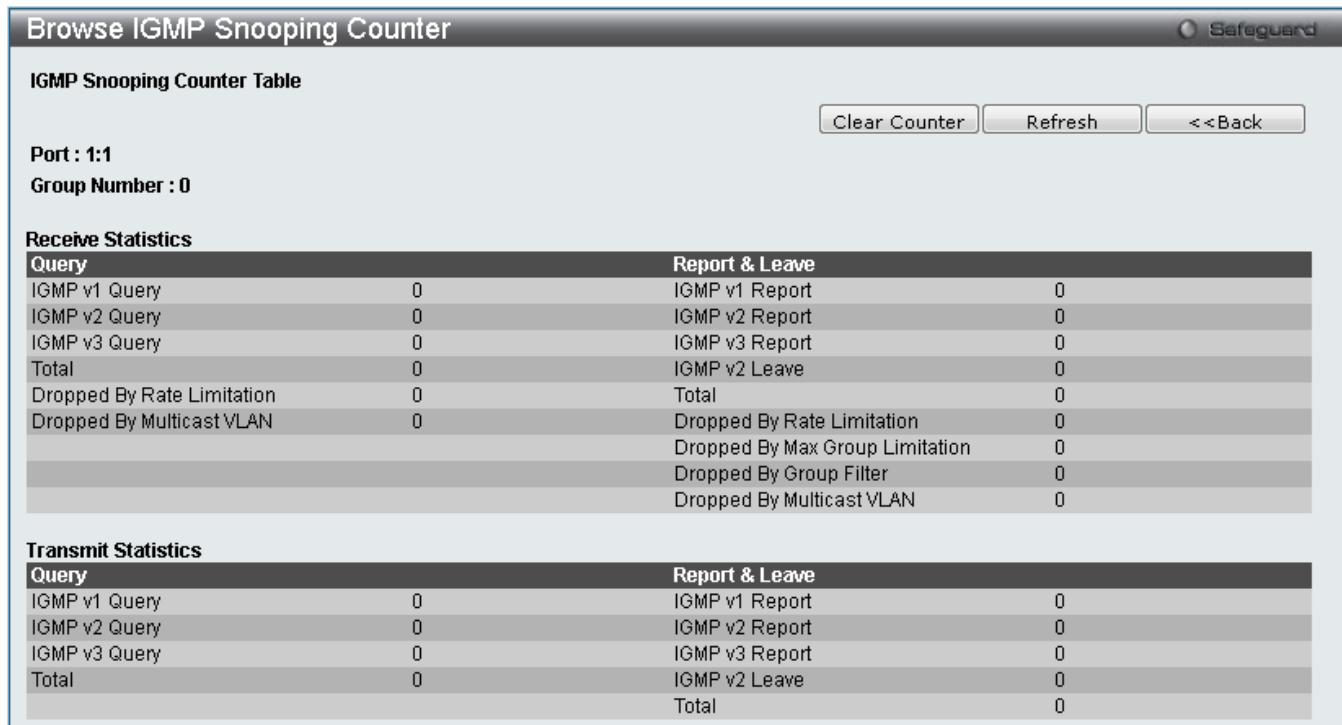

Figure 4-64 Browse IGMP Snooping Counter window

Click the **Clear Counter** button to clear all the information displayed in the fields.

Click the **Refresh** button to refresh the display table so that new information will appear.

Click the **<<Back** button to return to the previous page.

## IGMP Snooping Forward Lookup Mode Settings

This window is used to configure the IGMP Snooping forwarding mode settings.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Snooping > IGMP Snooping Forward Lookup Mode Settings**, as show below:

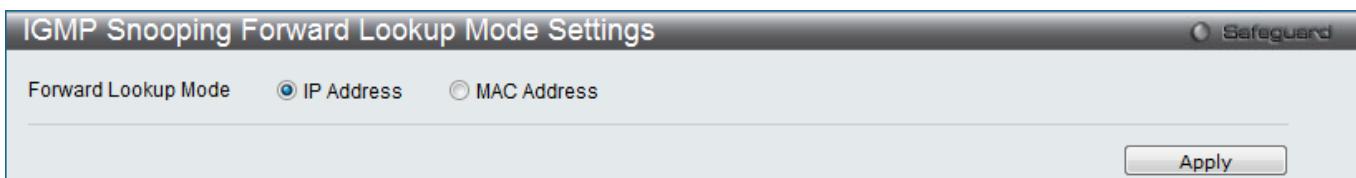

Figure 4-65 IGMP Snooping Forward Lookup Mode Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Forward Lookup Mode</b>	Select the appropriate IGMP Snooping forwarding lookup mode here. <i>IP Address</i> - Specifies that the multicast forwarding lookup will be based on the IP address. <i>MAC Address</i> - Specifies that the multicast forwarding lookup will be based on the MAC address

Click the **Apply** button to accept the changes made.

## MLD Proxy

### MLD Proxy Settings

This window is used to configure the MLD proxy state and MLD proxy upstream interface.

To view the following window, click **L2 Features > L2 Multicast Control > MLD Proxy > MLD Proxy Settings**, as show below:

The screenshot shows the 'MLD Proxy Settings' window. At the top, there's a 'MLD Proxy Global Settings' section with a radio button for 'Enabled' (selected) and one for 'Disabled'. An 'Apply' button is to the right. Below this is the 'MLD Proxy Upstream Settings' section, which includes fields for 'VLAN Name' (set to 'default'), 'VID' (set to '1'), 'Source IP Address' (set to '::'), and 'Unsolicited Report Interval (0-25)' (set to '10 sec'). There's also a 'Safeguard' button at the top right. The main area contains two sets of port selection buttons for 'Unit 1'. The first set, 'Static Router Port', has ports 1 through 26 listed with checkboxes. The second set, 'Dynamic Router Port', also has ports 1 through 26 listed with checkboxes. Both sets have 'Select All', 'Clear All', and 'Apply' buttons.

Figure 4-66 MLD Proxy Settings window

The fields that can be configured are described below:

Parameter	Description
<b>MLD Proxy State</b>	Use the radio buttons to enable or disable the MLD Proxy Global State.
<b>VLAN Name</b>	Click the radio button and enter the VLAN name for the interface.
<b>VID</b>	Click the radio button and enter the VLAN ID for the interface.
<b>Source IP Address</b>	Enter the source IPv6 address of the upstream protocol packet. If it is not specified, zero IP address will be used as the protocol source IP address.
<b>Unsolicited Report Interval (0-25)</b>	The Unsolicited report interval. It is the time between repetitions of the host's initial report of membership in a group. Default is 10 seconds. If set to 0, it means to send only one report packet.
<b>Unit</b>	Select the unit you wish to configure.
<b>Static Router Port</b>	Select the port that will be included in this configuration.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Select All** button to select all the ports for configuration.

Click the **Clear All** button to unselect all the ports for configuration.

## MLD Proxy Downstream Settings

This window is used to configure the MLD proxy downstream interface in this page. The MLD proxy downstream interface must be an MLD snooping enabled VLAN.

To view the following window, click **L2 Features > L2 Multicast Control > MLD Proxy > MLD Proxy Downstream Settings**, as show below:

The screenshot shows the 'MLD Proxy Downstream Settings' window. At the top left is the title 'MLD Proxy Downstream Settings'. On the right is a 'Safeguard' button. Below the title are two radio buttons: one for 'VLAN Name' (selected) and one for 'VID List'. To the right of each is an input field with placeholder text '(Max: 32 characters)' and '(e.g.: 1-3, 5)'. Below these fields is a dropdown menu labeled 'Downstream Action' with 'Add' selected. To the right of the dropdown is an 'Apply' button. At the bottom left is a section labeled 'Downstream VID List'.

Figure 4-67 MLD Proxy Downstream Settings window

The fields that can be configured are described below:

Parameter	Description
VLAN Name	Enter the VLAN Name which belongs to the MLD proxy downstream interface.
VID List	Enter a list of VLANs which belong to the MLD proxy downstream interface.
Downstream Action	Use the drop-down menu to add or delete a downstream interface.

Click the **Apply** button to accept the changes made.

## MLD Proxy Group

This window displays the MLD Proxy Group settings.

To view the following window, click **L2 Features > L2 Multicast Control > MLD Proxy > MLD Proxy Group**, as show below:

MLD Proxy Group			
Total Entries: 32			
Group No.	Destination IP Address	Source IP Address	
1	FF1E::21	NULL	<a href="#">Member Ports</a>
2	FF1E::22	NULL	<a href="#">Member Ports</a>
3	FF1E::23	NULL	<a href="#">Member Ports</a>
4	FF1E::24	NULL	<a href="#">Member Ports</a>
5	FF1E::25	NULL	<a href="#">Member Ports</a>
6	FF1E::26	NULL	<a href="#">Member Ports</a>
7	FF1E::27	NULL	<a href="#">Member Ports</a>
8	FF1E::28	NULL	<a href="#">Member Ports</a>
9	FF1E::29	NULL	<a href="#">Member Ports</a>
10	FF1E::2A	NULL	<a href="#">Member Ports</a>

## MLD Snooping

Multicast Listener Discovery (MLD) Snooping is an IPv6 function used similarly to IGMP snooping in IPv4. It is used to discover ports on a VLAN that are requesting multicast data. Instead of flooding all ports on a selected VLAN with multicast traffic, MLD snooping will only forward multicast data to ports that wish to receive this data through the use of queries and reports produced by the requesting ports and the source of the multicast traffic.

MLD snooping is accomplished through the examination of the layer 3 part of an MLD control packet transferred between end nodes and a MLD router. When the Switch discovers that this route is requesting multicast traffic, it adds the port directly attached to it into the correct IPv6 multicast table, and begins the process of forwarding multicast traffic to that port. This entry in the multicast routing table records the port, the VLAN ID, and the associated multicast IPv6 multicast group address, and then considers this port to be an active listening port. The active listening ports are the only ones to receive multicast group data.

## MLD Control Messages

Three types of messages are transferred between devices using MLD snooping. These three messages are all defined by four ICMPv6 packet headers, labeled 130, 131, 132, and 143.

1. **Multicast Listener Query** – Similar to the IGMPv2 Host Membership Query for IPv4, and labeled as 130 in the ICMPv6 packet header, this message is sent by the router to ask if any link is requesting multicast data. There are two types of MLD query messages emitted by the router. The General Query is used to advertise all multicast addresses that are ready to send multicast data to all listening ports, and the Multicast Specific query, which advertises a specific multicast address that is also ready. These two types of messages are distinguished by a multicast destination address located in the IPv6 header and a multicast address in the Multicast Listener Query Message.
2. **Multicast Listener Report, Version 1** – Comparable to the Host Membership Report in IGMPv2, and labeled as 131 in the ICMPv6 packet header, this message is sent by the listening port to the Switch stating that it is interested in receiving multicast data from a multicast address in response to the Multicast Listener Query message.
3. **Multicast Listener Done** – Akin to the Leave Group Message in IGMPv2, and labeled as 132 in the ICMPv6 packet header, this message is sent by the multicast listening port stating that it is no longer interested in receiving multicast data from a specific multicast group address, therefore stating that it is “done” with the multicast data from this address. Once this message is received by the Switch, it will no longer forward multicast traffic from a specific multicast group address to this listening port.
4. **Multicast Listener Report, Version 2** – Comparable to the Host Membership Report in IGMPv3, and labeled as 143 in the ICMPv6 packet header, this message is sent by the listening port to the Switch stating that it is interested in receiving multicast data from a multicast address in response to the Multicast Listener Query message.

## MLD Snooping Settings

Users can configure the settings for MLD snooping.

To view the following window, click **L2 Features > L2 Multicast Control > MLD Snooping > MLD Snooping Settings**, as show below:

The screenshot shows the 'MLD Snooping Settings' window. It includes sections for 'MLD Snooping Global Settings' (with 'Enabled' selected), 'MLD Data Driven Learning Settings' (Max Learned Entry Value set to 120), and a table of learned entries. The table has 2 total entries, with rows for VID 1 (VLAN Name: default, State: Disabled) and VID 2 (VLAN Name: PVLAN, State: Disabled). Each entry has 'Modify Router Port' and 'Edit' buttons, and a navigation bar at the bottom shows 1/1, 1, and Go.

Total Entries: 2		
VID	VLAN Name	State
1	default	Disabled
2	PVLAN	Disabled

Figure 4-70 MLD Snooping Settings window

The fields that can be configured are described below:

Parameter	Description
<b>MLD Snooping State</b>	Click the radio buttons to enable or disable the MLD snooping state.
<b>Max Learned Entry Value</b>	Enter the maximum number of groups that can be learned by data driven feature here. This value must be between 1 and 480.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Edit** button to configure the MLD Snooping Parameters Settings for a specific entry.

Click the [Modify Router Port](#) link to configure the MLD Snooping Router Port Settings for a specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

After clicking the **Edit** button, the following page will appear:

MLD Snooping Parameters Settings			
VID	1	VLAN Name	default
Rate Limit	No Limitation	Querier IP	::
Querier Expiry Time	0 sec	Query Interval (1-65535)	125 sec
Max Response Time (1-25)	10 sec	Robustness Value (1-7)	2
Last Listener Query Interval (1-25)	1 sec	Data Driven Group Expiry Time (1-65535)	260 sec
Proxy Reporting Source IP	:: (e.g.: IPv6 Link-Local Address or ::)	Proxy Reporting State	Disabled
Querier State	Enabled	Fast Done	Disabled
State	Disabled	Data Driven Learning State	Enabled
Data Driven Learning Aged Out	Disabled	Version	2
Querier Role	Non-Querier		
<input type="button" value="&lt;&lt;Back"/> <input type="button" value="Apply"/>			

**Figure 4-71 MLD Snooping Parameters Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Query Interval (1-65535)</b>	Specify the amount of time in seconds between general query transmissions. The default setting is 125 seconds.
<b>Max Response Time (1-25)</b>	The maximum time in seconds to wait for reports from listeners. The default setting is 10 seconds.
<b>Robustness Value (1-7)</b>	Provides fine-tuning to allow for expected packet loss on a subnet. The value of the robustness variable is used in calculating the following MLD message intervals: <i>Group listener interval</i> - Amount of time that must pass before a multicast router decides there are no more listeners of a group on a network. <i>Other Querier present interval</i> - Amount of time that must pass before a multicast router decides that there is no longer another multicast router that is the Querier. <i>Last listener query count</i> - Number of group-specific queries sent before the router assumes there are no local listeners of a group. The default number is the value of the robustness variable. By default, the robustness variable is set to 2. You might want to increase this value if you expect a subnet to be loosely.
<b>Last Listener Query Interval (1-25)</b>	The maximum amount of time between group-specific query messages, including those sent in response to done-group messages. You might lower this interval to reduce the amount of time it takes a router to detect the loss of the last listener of a group.
<b>Data Driven Group Expiry Time</b>	Specifies the data driven group lifetime value used. This value is only applicable if the aged out option is enabled.
<b>Proxy Reporting Source IP</b>	Enter the proxy reporting source IPv6 address.
<b>Proxy Reporting State</b>	Use the drop-down menu to enable and disable the proxy report state.
<b>Querier State</b>	This allows the switch to be specified as an MLD Querier (sends MLD query packets) or a Non-Querier (does not send MLD query packets). Set to enable or disable.
<b>Fast Done</b>	Use the drop-down menu to enable or disable the fast done feature.
<b>State</b>	Used to enable or disable MLD snooping for the specified VLAN. This field is <i>Disabled</i> .

	by default.
<b>Data Driven Learning State</b>	Specifies to enable or disable the data driven learning of a MLD snooping group. When the data-driven learning is enabled for the VLAN, when the switch receives the IP multicast traffic, on this VLAN, an MLD snooping group will be created. That is, the learning of an entry is not activated by MLD membership registration, but activated by the traffic. For an ordinary MLD snooping entry, the MLD protocol will take care the aging out of the entry. For a data-driven entry, the entry can be specified not to be aged out or to be aged out by the aged timer. When the data driven learning is enabled, and data driven table is not full, the multicast filtering mode for all ports are ignored. That is, the multicast packets will be forwarded to router ports. If data driven learning table is full, the multicast packets will be forwarded according to multicast filtering mode. <b>Note:</b> If a data-driven group is created and MLD member ports are learned later, the entry will become an ordinary MLD snooping entry. That is, the aging out mechanism will follow the ordinary MLD snooping entry.
<b>Data Driven Learning Aged Out</b>	Specifies to enable or disable the aging of the entry. This is disabled by default.
<b>Version</b>	Specify the version of MLD packet that will be sent by this port. If a MLD packet received by the interface has a version higher than the specified version, this packet will be forwarded from the router ports or VLAN flooding.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

After clicking the [Modify Router Port](#) link, the following page will appear:

VID: 1      VLAN Name: default

Unit: 1

**Static Router Port:**

01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26
<input type="checkbox"/>																									

**Forbidden Router Port:**

01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26
<input type="checkbox"/>																									

**Dynamic Router Port:**

01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26
<input type="checkbox"/>																									

**Router IP Table**

NO.	Router IP
-----	-----------

[\*\*<<Back\*\*](#) **Apply**

Figure 4-72 MLD Snooping Router Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Static Router Port</b>	This section is used to designate a range of ports as being connected to multicast-enabled routers. This will ensure that all packets with such a router as its destination will reach the multicast-enabled router regardless of the protocol.
<b>Forbidden Router Port</b>	This section is used to designate a range of ports as being not connected to multicast-

	enabled routers. This ensures that the forbidden router port will not propagate routing packets out.
<b>Dynamic Router Port</b>	Displays router ports that have been dynamically configured.

Click the **Select All** button to select all the ports for configuration.

Click the **Clear All** button to unselect all the ports for configuration.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

## MLD Snooping Rate Limit Settings

Users can configure the rate limit of the MLD control packet that the switch can process on a specific port or VLAN in this page.

To view the following window, click **L2 Features > L2 Multicast Control > MLD Snooping > MLD Snooping Rate Limit Settings**, as show below:

Total Entries: 2	
VID	Rate Limit
1	No Limit
2	No Limit

Figure 4-73 MLD Snooping Rate Limit Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Port List</b>	Enter the Port List here.
<b>VID List</b>	Enter the VID List value here.
<b>Rate Limit</b>	Configure the rate limit of MLD control packet that the switch can process on a specific port/VLAN. The rate is specified in packet per second. The packet that exceeds the limited rate will be dropped. Selecting the <b>No Limit</b> option lifts the rate limit requirement.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Edit** button to re-configure the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## MLD Snooping Static Group Settings

This page used to configure the MLD snooping multicast group static members.

To view the following window, click **L2 Features > L2 Multicast Control > MLD Snooping > MLD Snooping Static Group Settings**, as show below:

The screenshot shows the 'MLD Snooping Static Group Settings' window. At the top, there are three configuration options: 'VLAN Name' (radio button selected), 'VID List' (radio button unselected), and 'IPv6 Address'. Below these are input fields for each option. To the right of the input fields are three buttons: 'Find', 'Create', and 'Delete'. Further right is a 'View All' button. A message 'Total Entries: 1' is displayed above a table. The table has columns for VID, VLAN Name, IP Address, and Static Member Port. It contains one row with VID 1, VLAN Name 'default', IP Address 'FF56::123', and an empty 'Static Member Port' field. To the right of the table are 'Edit' and 'Delete' buttons. At the bottom right are page navigation buttons '1/1', '1', and 'Go'.

Figure 4-74 MLD Snooping Static Group Settings window

The fields that can be configured are described below:

Parameter	Description
VLAN Name	The name of the VLAN on which the static group resides.
VID List	The ID of the VLAN on which the static group resides.
IPv6 Address	Specify the multicast group IPv6 address.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Create** button to add a static group.

Click the **Delete** button to delete a static group.

Click the **View All** button to display all the existing entries.

Click the **Edit** button to re-configure the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

After clicking the **Edit** button, the following page will appear:

The screenshot shows the 'MLD Snooping Static Group Settings – Edit' window. At the top, it displays VID: 1, VLAN Name: default, and IPv6 Address: FF56::123. Below this is a 'Ports:' section with a dropdown menu set to 'Unit 1'. Underneath is a horizontal row of 26 checkboxes, each corresponding to a port number from 01 to 26. The checkboxes for ports 1 through 18 are checked. To the right of the checkboxes are two buttons: 'Select All' and 'Clear All'. At the bottom are two more buttons: '<< Back' and 'Apply'.

Figure 4-75 MLD Snooping Static Group Settings – Edit window

The fields that can be configured are described below:

Parameter	Description
Unit	Select the unit you wish to configure.

Click the **Select All** button to select all the ports for configuration.

Click the **Clear All** button to unselect all the ports for configuration.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

## MLD Router Port

Users can display which of the Switch's ports are currently configured as router ports in IPv6. A router port configured by a user (using the console or Web-based management interfaces) is displayed as a static router port, designated by S. A router port that is dynamically configured by the Switch is designated by D, while a Forbidden port is designated by F.

To view the following window, click **L2 Features > L2 Multicast Control > MLD Snooping > MLD Router Port**, as show below:

The screenshot shows the 'MLD Router Port' configuration window. At the top, there is a search bar with 'VID' and a 'Find' button. Below it, a table displays port configurations for VLAN 1. The table has columns for 'Unit' (1), 'Port' (01-26), and various status indicators. A note at the bottom explains the abbreviations: S:Static Router Port, D:Dynamic Router Port, F:Forbidden Router Port.

Unit	Port																									
	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26
1																										

**Note:** S:Static Router Port, D:Dynamic Router Port, F:Forbidden Router Port

**Figure 4-76 MLD Router Port window**

Enter a VID (VLAN ID) in the field at the top of the window.

Click the **Find** button to locate a specific entry based on the information entered.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

**NOTE:** The abbreviations used on this page are **Static Router Port (S)**, **Dynamic Router Port (D)** and **Forbidden Router Port (F)**.

## MLD Snooping Group

Users can view MLD Snooping Groups present on the Switch. MLD Snooping is an IPv6 function comparable to IGMP Snooping for IPv4.

To view the following window, click **L2 Features > L2 Multicast Control > MLD Snooping > MLD Snooping Group**, as show below:

The screenshot shows the 'MLD Snooping Group' configuration window. It includes search fields for 'VLAN Name', 'VID List', 'Port List', and 'Group IPv6 Address', along with 'Data Driven' checkboxes and 'Find' and 'Clear Data Driven' buttons. Below is a table of MLD Snooping Groups with columns for VID, VLAN Name, Source, Group, Member Port, Router Port, Group Type, Up Time, Expiry Time, and Filter Mode. A note at the bottom indicates 0 total entries.

Total Entries: 0								
VID	VLAN Name	Source	Group	Member Port	Router Port	Group Type	Up Time	Expiry Time

**Figure 4-77 MLD Snooping Group window**

The fields that can be configured are described below:

Parameter	Description
VLAN Name	Click the radio button and enter the VLAN name of the multicast group.
VID List	Click the radio button and enter a VLAN list of the multicast group.
Port List	Specify the port number(s) used to find a multicast group.
Group IPv6 Address	Enter the group IPv6 address used here.
Data Driven	Specifies whether to enable or disable the data driven learning of an MLD snooping group. This is enabled by default.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Clear Data Driven** button to clear data driven information for the specified entry.

Click the **Clear All Data Driven** button to clear data driven information for all entries.

## MLD Snooping Forwarding Table

This page displays the switch's current MLD snooping forwarding table. It provides an easy way for user to check the list of ports that the multicast group comes from and specific sources that it will be forwarded to. The packet comes from the source VLAN. They will be forwarded to the forwarding VLAN. The MLD snooping further restricts the forwarding ports.

To view the following window, click **L2 Features > L2 Multicast Control > MLD Snooping > MLD Snooping Forwarding Table**, as show below:

Figure 4-78 MLD Snooping Forwarding Table window

The fields that can be configured are described below:

Parameter	Description
VLAN Name	The name of the VLAN for which you want to view MLD snooping forwarding table information.
VID List	The ID of the VLAN for which you want to view MLD snooping forwarding table information.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

## MLD Snooping Counter

This page displays the statistics counter for MLD protocol packets that are received by the switch since MLD Snooping is enabled.

To view the following window, click **L2 Features > L2 Multicast Control > MLD Snooping > MLD Snooping Counter**, as show below:

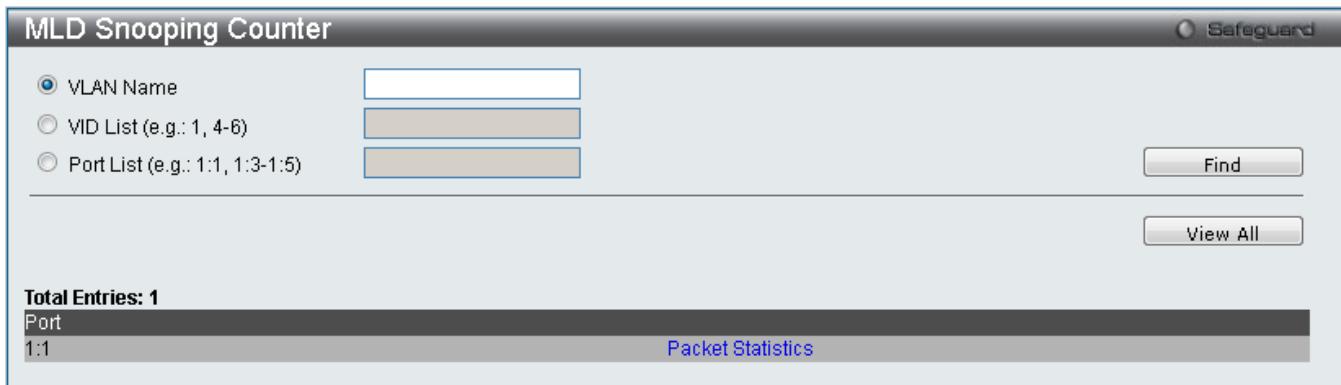

Figure 4-79 MLD Snooping Counter window

The fields that can be configured are described below:

Parameter	Description
VLAN Name	Specify a VLAN name to be displayed.
VID List	Specify a list of VLANs to be displayed.
Port List	Specify a list of ports to be displayed.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the [Packet Statistics](#) link to view the MLD Snooping Counter Settings for the specific entry.

After clicking the [Packet Statistics](#) link, the following page will appear:

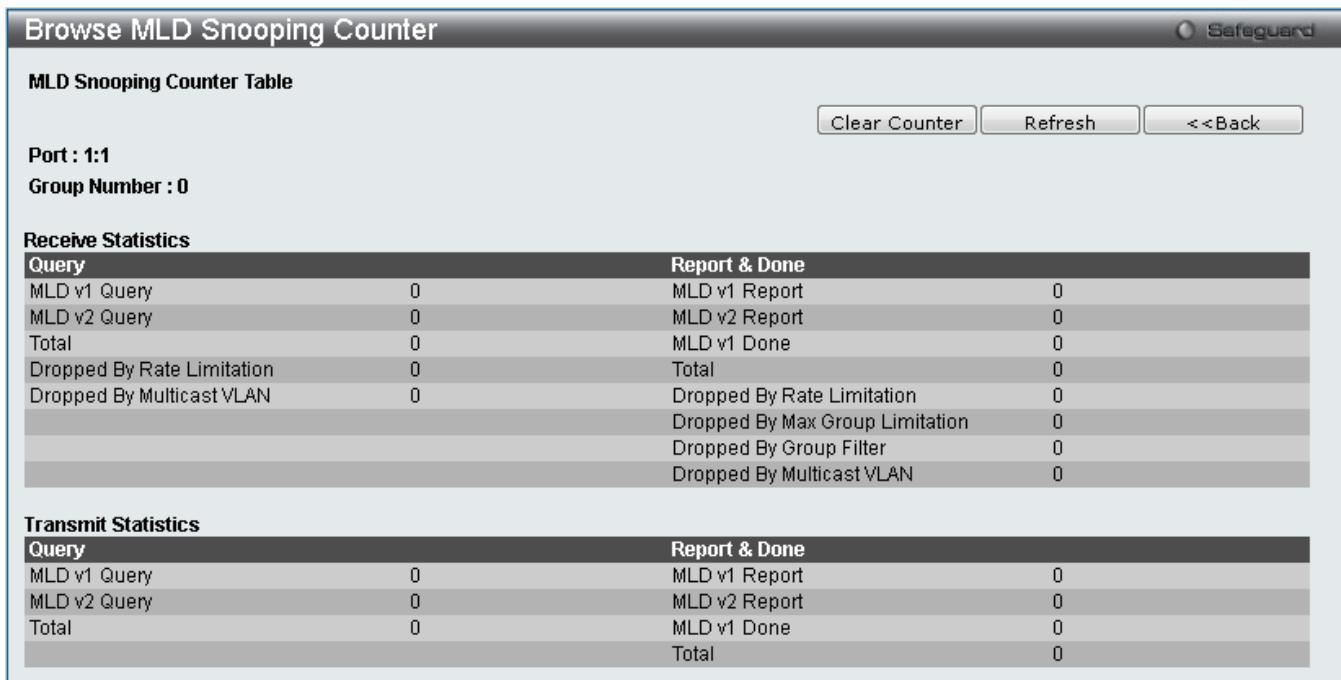

Figure 4-80 Browse MLD Snooping Counter window

Click the **Clear Counter** button to clear all the information displayed in the fields.

Click the **Refresh** button to refresh the display table so that new information will appear.

Click the **<<Back** button to return to the previous page.

## Multicast VLAN

In a switching environment, multiple VLANs may exist. Every time a multicast query passes through the Switch, the switch must forward separate different copies of the data to each VLAN on the system, which, in turn, increases data traffic and may clog up the traffic path. To lighten the traffic load, multicast VLANs may be incorporated. These multicast VLANs will allow the Switch to forward this multicast traffic as one copy to recipients of the multicast VLAN, instead of multiple copies.

Regardless of other normal VLANs that are incorporated on the Switch, users may add any ports to the multicast VLAN where they wish multicast traffic to be sent. Users are to set up a source port, where the multicast traffic is entering the switch, and then set the ports where the incoming multicast traffic is to be sent. The source port cannot be a recipient port and if configured to do so, will cause error messages to be produced by the switch. Once properly configured, the stream of multicast data will be relayed to the receiver ports in a much more timely and reliable fashion.

### **Restrictions and Provisos:**

The Multicast VLAN feature of this Switch does have some restrictions and limitations, such as:

1. Multicast VLANs can be implemented on edge and non-edge switches.
2. Member ports and source ports can be used in multiple Multicast VLANs. But member ports and source ports cannot be the same port in a specific Multicast VLAN.
3. The Multicast VLAN is exclusive with normal 802.1q VLANs, which means that VLAN IDs (VIDs) and VLAN Names of 802.1q VLANs and Multicast VLANs cannot be the same. Once a VID or VLAN Name is chosen for any VLAN, it cannot be used for any other VLAN.
4. The normal display of configured VLANs will not display configured Multicast VLANs.
5. Once a Multicast VLAN is enabled, the corresponding IGMP snooping state or MLD snooping state of this VLAN will also be enabled. Users cannot disable the IGMP snooping and MLD snooping feature for an enabled Multicast VLAN.
6. One IP multicast address cannot be added to multiple Multicast VLANs, yet multiple Ranges can be added to one Multicast VLAN.

## IGMP Multicast Group Profile Settings

Users can add a profile to which multicast address reports are to be received on specified ports on the Switch. This function will therefore limit the number of reports received and the number of multicast groups configured on the Switch. The user may set an IP Multicast address or range of IP Multicast addresses to accept reports (Permit) or deny reports (Deny) coming into the specified switch ports.

To view the following window, click **L2 Features > L2 Multicast Control > Multicast VLAN > IGMP Multicast Group Profile Settings**, as show below:

IGMP Multicast Group Profile Settings	
Profile Name	(Max: 32 characters)
Add Find Delete All View All	
<b>Total Entries: 1</b>	
Profile Name	MGroup
Group List Delete	

Figure 4-81 IGMP Multicast Group Profile Settings window

The fields that can be configured are described below:

Parameter	Description
-----------	-------------

<b>Profile Name</b>	Enter a name for the IP Multicast Profile.
Click the <b>Add</b> button to add a new entry based on the information entered.	
Click the <b>Find</b> button to locate a specific entry based on the information entered.	
Click the <b>Delete All</b> button to remove all the entries listed.	
Click the <b>View All</b> button to display all the existing entries.	
Click the <b>Delete</b> button to remove the corresponding entry.	
Click the <a href="#">Group List</a> link to configure the Multicast Group Profile Address Settings for the specific entry.	

After clicking the [Group List](#) link, the following page will appear:

The screenshot shows a configuration window titled "Multicast Address Group List Settings". It has fields for "Profile ID" (1), "Profile Name" (PName), and "Multicast Address List" (FF1E::1). Buttons include "Add", "<< Back", "Edit", and "Delete". Below the form is a table titled "Multicast Address Group List: 1" with one row showing NO. 1 and Multicast Address List FF1E::1. There are "Edit" and "Delete" buttons for this row.

Figure 4-82 Multicast Group Profile Multicast Address Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Multicast Address List</b>	Enter the multicast address list value. Click the <b>Add</b> button to add a new entry based on the information entered. Click the <b>&lt;&lt;Back</b> button to discard the changes made and return to the previous page. Click the <b>Delete</b> button to remove the corresponding entry.

## IGMP Snooping Multicast VLAN Settings

On this page the user can configure the IGMP snooping multicast VLAN parameters.

To view the following window, click **L2 Features > L2 Multicast Control > Multicast VLAN > IGMP Snooping Multicast VLAN Settings**, as show below:

The screenshot shows a configuration window titled "IGMP Snooping Multicast VLAN Settings". It includes sections for "IGMP Multicast VLAN State" (Enabled/Disabled), "IGMP Multicast VLAN Forward Unmatched" (Enabled/Disabled), "IGMP Multicast VLAN Auto Assign VLAN" (Enabled/Disabled), and a "VLAN Name" input field with "VID (2-4094)" and "Remap Priority" dropdowns. Buttons for "Apply" and "Add" are present. Below the form is a table titled "Total Entries: 1" with one row showing VID 3 and VLAN Name MVLAN. There are "Edit" and "Delete" buttons for this row.

Figure 4-83 IGMP Snooping Multicast VLAN Settings window

The fields that can be configured are described below:

Parameter	Description
<b>IGMP Multicast VLAN State</b>	Click the radio buttons to enable or disable the IGMP Multicast VLAN state.
<b>IGMP Multicast VLAN Forward Unmatched</b>	Click the radio buttons to enable or disable the IGMP Multicast VLAN Forwarding state.
<b>IGMP Multicast VLAN Auto Assign VLAN</b>	Specifies to enable or disable the assignment of IGMP control packets to the right Multicast VLAN. If auto assign VLAN is enabled, the Switch will check for group matching with multicast VLAN profiles of which the ingress port belongs to. If there is a match, the result is "in profile" and the matching multicast VLAN will be set as a packet VLAN. If this function is disabled, the Switch will do VID checking, and afterwards, if the group does not match the current profile binding, the Switch will drop this packet.
<b>VLAN Name</b>	Enter the VLAN Name used.
<b>VID (2-4094)</b>	Enter the VID used.
<b>Remap Priority</b>	0-7 – The remap priority value (0 to 7) to be associated with the data traffic to be forwarded on the multicast VLAN.  <i>None</i> – If <b>None</b> is specified, the packet's original priority is used. The default setting is <b>None</b> .
<b>Replace Priority</b>	Tick the check box to specify that the packet's priority will be changed by the Switch, based on the remap priority. This flag will only take effect when the remap priority is set.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Add** button to add a new entry based on the information entered.

Click the **Edit** button to configure the IGMP Snooping Multicast VLAN Settings for the specific entry.

Click the **Delete** button to remove the specific entry.

Click the [Profile List](#) link to configure the IGMP Snooping Multicast VLAN Settings for the specific entry.

After clicking the **Edit** button, the following page will appear:

**IGMP Snooping Multicast VLAN Settings**

Safeguard

VLAN Name	MVLAN
State	Disabled

<input type="checkbox"/>	
<input type="button" value="&lt;&lt; Back"/> <input type="button" value="Apply"/>	

Figure 4-84 IGMP Snooping Multicast VLAN Settings – Edit window

The fields that can be configured are described below:

Parameter	Description
<b>State</b>	Use the drop-down menu to enable or disable the state.
<b>Replace Source IP</b>	With the IGMP snooping function, the IGMP report packet sent by the host will be forwarded to the source port. Before forwarding of the packet, the source IP address in the join packet needs to be replaced by this IP address. If none is specified, the source IP address will use zero IP address.
<b>Remap Priority</b>	0-7 – The remap priority value (0 to 7) to be associated with the data traffic to be forwarded on the multicast VLAN. <i>None</i> – If <b>None</b> is specified, the packet's original priority is used. The default setting is None.
<b>Replace Priority</b>	Specify that the packet's priority will be changed by the switch, based on the remap priority. This flag will only take effect when the remap priority is set.
<b>Unit</b>	Select the unit you wish to configure.
<b>Untagged Member Ports</b>	Specify the untagged member port of the multicast VLAN.
<b>Tagged Member Ports</b>	Specify the tagged member port of the multicast VLAN.
<b>Untagged Source Ports</b>	Specify the untagged source port where the multicast traffic is entering the Switch. The PVID of the untagged source port is automatically changed to the multicast VLAN. Source ports must be either tagged or untagged for any single multicast VLAN, i.e. both types cannot be members of the same multicast VLAN.
<b>Tagged Source Ports</b>	Specify the source port or range of source ports as tagged members of the multicast VLAN.

Click the **Select All** button to select all the ports for configuration.

Click the **Clear All** button to unselect all the ports for configuration.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

After clicking the [Profile List](#) link, the following page will appear:

IGMP Snooping Multicast VLAN Group List Settings		Safeguard
VID	3	
VLAN Name	MVLAN	
Profile Name	MGroup	Add
<b>IGMP Snooping Multicast VLAN Group List</b>		
NO.	Multicast Group Profiles	
1	MGroup	Delete
<a href="#">Show IGMP Snooping Multicast VLAN Entries</a>		

Figure 4-85 IGMP Snooping Multicast VLAN Group List Settings window

The fields that can be configured or displayed are described below:

Parameter	Description
<b>VID</b>	Display the VLAN ID.
<b>VLAN Name</b>	Display the VLAN name.
<b>Profile Name</b>	Use the drop-down menu to select the IGMP Snooping Multicast VLAN Group Profile name.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry.

Click the [Show IGMP Snooping Multicast VLAN Entries](#) link to view the IGMP Snooping Multicast VLAN Settings.

## MLD Multicast Group Profile Settings

Users can add, delete, or configure the MLD multicast group profile on this page.

To view the following window, click **L2 Features > L2 Multicast Control > Multicast VLAN > MLD Multicast Group Profile Settings**, as show below:

MLD Multicast Group Profile Settings	
Profile Name	<input type="text"/> (Max: 32 characters)
<input type="button" value="Add"/> <input type="button" value="Find"/> <input type="button" value="Delete All"/> <input type="button" value="View All"/>	
<b>Total Entries: 1</b> Profile Name: M2Group M2Group <span style="float: right;"><a href="#">Group List</a> <input type="button" value="Delete"/></span>	

Figure 4-86 MLD Multicast Group Profile Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Profile Name</b>	Enter the MLD Multicast Group Profile name.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

Click the **View All** button to display all the existing entries.

Click the [Group List](#) link to configure the Multicast Group Profile Multicast Address Settings for the specific entry.

Click the **Delete** button to remove the specific entry.

After clicking the [Group List](#) link, the following page will appear:

Multicast Group Profile Multicast Address Settings	
Profile Name	M2Group
Multicast Address List	<input type="text"/> (e.g.: FF1E::1-FF1E::3)

Figure 4-89 MLD Snooping Multicast VLAN Settings – Edit window

The fields that can be configured are described below:

Parameter	Description
<b>State</b>	Use the drop-down menu to enable or disable the state.
<b>Replace Source IP</b>	With the MLD snooping function, the MLD report packet sent by the host will be forwarded to the source port. Before forwarding of the packet, the source IP address in the join packet needs to be replaced by this IP address. If none is specified, the source IP address will use zero IP address.
<b>Remap Priority</b>	0-7 – The remap priority value (0 to 7) to be associated with the data traffic to be forwarded on the multicast VLAN. <i>Note</i> – If <b>None</b> is specified, the packet's original priority is used. The default setting is <b>None</b> .
<b>Replace Priority</b>	Tick the check box to specify that the packet's priority will be changed by the switch, based on the remap priority. This flag will only take effect when the remap priority is set.
<b>Unit</b>	Select the unit you wish to configure.
<b>Untagged Member Ports</b>	Specify the untagged member port of the multicast VLAN.
<b>Tagged Member Ports</b>	Specify the tagged member port of the multicast VLAN.
<b>Untagged Source Ports</b>	Specify the untagged source port where the multicast traffic is entering the Switch. The PVID of the untagged source port is automatically changed to the multicast VLAN. Source ports must be either tagged or untagged for any single multicast VLAN, i.e. both types cannot be members of the same multicast VLAN.
<b>Tagged Source Ports</b>	Specify the source port or range of source ports as tagged members of the multicast VLAN.

Click the **Select All** button to select all the ports for configuration.

Click the **Clear All** button to unselect all the ports for configuration.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

After clicking the [Profile List](#) link, the following page will appear:

The screenshot shows the 'MLD Snooping Multicast VLAN Group List Settings' window. At the top, there are fields for VID (set to 4), VLAN Name (M2VLAN), and Profile Name (M2Group). A 'Safeguard' checkbox is also present. Below these, a table lists 'MLD Snooping Multicast VLAN Group List' with one entry: NO. 1, Multicast Group Profiles M2Group. An 'Add' button is on the right, and a 'Delete' button is next to the entry. A link 'Show MLD Snooping Multicast VLAN Entries' is at the bottom left.

**Figure 4-90 MLD Snooping Multicast VLAN Group List Settings window**

The fields that can be configured are described below:

Parameter	Description
Profile Name	Use the drop-down menu to select the MLD Snooping Multicast VLAN Group Profile name.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry.

Click the [Show MLD Snooping Multicast VLAN Entries](#) link to view the MLD Snooping Multicast VLAN Settings.

## IP Multicast VLAN Replication

Generally, multicast data cannot be forwarded across VLANs if the switch doesn't support any multicast routing protocol. IP Multicast VLAN Replication can achieve this, without any multicast protocol being supported. Users need to configure the desired source traffic and corresponding outgoing members.

### IP Multicast VLAN Replication Global Settings

On this page the user can configure the IP multicast VLAN replication parameters.

To view the following window, click **L2 Features > L2 Multicast Control > IP Multicast VLAN Replication > IP Multicast VLAN Replication Global Settings**, as show below:

The screenshot shows the 'IP Multicast VLAN Replication Global Settings' window. It contains three sets of radio button groups: 'Global State' (Enabled selected), 'TTL' (Decrease selected), and 'Source MAC Address' (Replace selected). An 'Apply' button is located at the bottom right.

**Figure 4-91 IP Multicast VLAN Replication Global Settings window**

The fields that can be configured are described below:

Parameter	Description
-----------	-------------

<b>Global State</b>	Here the user can enable or disable the global state feature.
<b>TTL</b>	Here the user can select to decrease or no decrease the Time to live (TTL) value in the packets.
<b>Source MAC Address</b>	Here the user can select to replace or not to replace the Source MAC Address of the packet.

Click the **Apply** button to accept the changes made.

## IP Multicast VLAN Replication Settings

On this page the user can add and view the IP multicast VLAN replication table.

To view the following window, click **L2 Features > L2 Multicast Control > IP Multicast VLAN Replication > IP Multicast VLAN Replication Settings**, as show below:

IP Multicast VLAN Replication Settings				
Add IP Multicast VLAN Replication Entry				
Entry Name	(Max: 16 characters)	Add	Find by Hardware	View All
Total Entries: 1				
Entry Name	VLAN Name	VID	Source	Destination
MVREEntry			Edit	Edit Delete

Figure 4-92 IP Multicast VLAN Replication Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Entry Name</b>	Here the user can enter a Multicast VLAN Replication entry name.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find by Hardware** the find an entry based on the hardware.

Click the **View All** button to display all the existing entries.

Click the **Edit** button under **Source** to re-configure the specific entry.

Click the **Edit** button under **Destination** to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

After clicking the **Edit** button under **Source**, the following page will appear:

IP Multicast VLAN Replication Source Settings				
Entry Name	MVREEntry	VID	VLAN Name	Group
VID / VLAN Name		<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>
Action	Add			
Multicast Address List				
Source Address		Apply		
<< Back				

Total Entries: 0		
Entry NO.	Multicast Group Address	Source Address

**Figure 4-93 IP Multicast VLAN Replication Settings window (Edit Source)**

The fields that can be configured are described below:

Parameter	Description
<b>Entry Name</b>	Here the IP Multicast VLAN Replication Source entry name will be displayed.
<b>VID / VLAN Name</b>	Here the user can choose to enter a VLAN Name, VID value or Group value.
<b>Action</b>	Here the user can select the action to be taken.
<b>Multicast Address List</b>	Here the user can enter the multicast address list.
<b>Source Address</b>	Here the user can enter the source address.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

After clicking the **Edit** button under **Destination**, the following page will appear:

Total Entries: 0	Entry NO.	VID	VLAN Name	PortList
------------------	-----------	-----	-----------	----------

**Figure 4-94 IP Multicast VLAN Replication Settings window (Edit Destination)**

The fields that can be configured are described below:

Parameter	Description
<b>Entry Name</b>	Here the IP Multicast VLAN Replication Destination entry name will be displayed.
<b>VID / VLAN Name</b>	Here the user can choose to enter a VLAN Name, VID value or Group value.
<b>Action</b>	Here the user can select the action to be taken.
<b>Port List</b>	Here the user can enter the port list.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

## Multicast Filtering

### IPv4 Multicast Filtering

#### IPv4 Multicast Profile Settings

Users can add a profile to which multicast address(s) reports are to be received on specified ports on the Switch. This function will therefore limit the number of reports received and the number of multicast groups configured on the Switch. The user may set an IPv4 Multicast address or range of IPv4 Multicast addresses to accept reports (Permit) or deny reports (Deny) coming into the specified switch ports.

To view the following window, click **L2 Features > Multicast Filtering > IPv4 Multicast Filtering > IPv4 Multicast Profile Settings**, as show below:

IPv4 Multicast Profile Settings		Safeguard
Profile ID (1-60)	Profile Name	
<input type="text"/>	<input type="text"/> (Max: 32 characters)	<input type="button" value="Add"/> <input type="button" value="Find"/>
<input type="button" value="Delete All"/>		
<b>Total Entries: 1</b>		
Profile ID 1	Profile Name PName	<a href="#">Group List</a> <input type="button" value="Edit"/> <input type="button" value="Delete"/>

Figure 4-95 IPv4 Multicast Profile Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID (1-60)</b>	Enter a Profile ID between 1 and 60.
<b>Profile Name</b>	Enter a name for the IP Multicast Profile.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

Click the [Group List](#) link to configure the multicast address group list settings for the specific entry.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

After clicking the [Group List](#) link, the following page will appear:

Multicast Address Group List Settings		Safeguard
Profile ID	1	
Profile Name	PName	
Multicast Address List	<input type="text"/> (e.g.: 235.2.2.1-235.2.2.2)	<input type="button" value="Add"/>
<input type="button" value="&lt;&lt;Back"/>		
<b>Multicast Address Group List: 1</b>		
NO.	Multicast Address List	
1	235.2.2.1	<input type="button" value="Edit"/> <input type="button" value="Delete"/>

Figure 4-96 Multicast Address Group List Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Multicast Address List</b>	Enter the multicast address list here.

Click the **Add** button to add a new entry based on the information entered.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## IPv4 Limited Multicast Range Settings

Users can configure the ports and VLANs on the Switch that will be involved in the Limited IPv4 Multicast Range. The user can configure the range of multicast ports that will be accepted by the source ports to be forwarded to the receiver ports.

To view the following window, click **L2 Features > Multicast Filtering > IPv4 Multicast Filtering > IPv4 Limited Multicast Range Settings**, as show below:

Figure 4-97 IPv4 Limited Multicast Range Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Ports / VID List</b>	Select the appropriate port(s) or VLAN IDs used for the configuration.
<b>Access</b>	Assign access permissions to the ports selected. Options listed are <i>Permit</i> and <i>Deny</i> .
<b>Profile ID / Profile Name</b>	Use the drop-down menu to select the profile ID or profile name used and then assign <i>Permit</i> or <i>Deny</i> access to them.

Click the **Apply** button to accept the changes made.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry.

Click the **Find** button to locate a specific entry based on the information entered.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## IPv4 Max Multicast Group Settings

Users can configure the ports and VLANs on the switch that will be a part of the maximum filter group, up to a maximum of 1024.

To view the following window, click **L2 Features > Multicast Filtering > IPv4 Multicast Filtering > IPv4 Max Multicast Group Settings**, as show below:

The screenshot shows the 'IPv4 Max Multicast Group Settings' window. At the top, there are two sets of input fields for 'Ports' and 'Max Group (1-960)'. Below these are buttons for 'Find' and 'Apply'. A message 'Total Entries: 3' is displayed above a table. The table has columns for VID, Max Multicast Group Number, and Action. It lists three entries: VID 1 with Max Group set to Infinite and Action to Drop; VID 2 with Max Group set to Infinite and Action to Drop; and VID 3 with Max Group set to Infinite and Action to Drop. Navigation buttons at the bottom right include '1/1', '1', and 'Go'.

Figure 4-98 IPv4 Max Multicast Group Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Ports / VID List</b>	Select the appropriate port(s) or VLAN IDs used for the configuration here.
<b>Max Group (1-960)</b>	If the checkbox <b>Infinite</b> is not selected, the user can enter a <b>Max Group</b> value.
<b>Infinite</b>	Tick the check box to enable or disable the use of the Infinite value.
<b>Action</b>	Use the drop-down menu to select the appropriate action for this rule. The user can select <i>Drop</i> to initiate the drop action or the user can select <i>Replace</i> to initiate the replace action.

Click the **Apply** button to accept the changes made.

Click the **Find** button to locate a specific entry based on the information entered.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## IPv6 Multicast Filtering

Users can add a profile to which multicast address(es) reports are to be received on specified ports on the Switch. This function will therefore limit the number of reports received and the number of multicast groups configured on the Switch. The user may set an IPv6 Multicast address or range of IPv6 Multicast addresses to accept reports (Permit) or deny reports (Deny) coming into the specified switch ports.

## IPv6 Multicast Profile Settings

Users can add, delete, and configure the IPv6 multicast profile on this page.

To view the following window, click **L2 Features > Multicast Filtering > IPv6 Multicast Filtering > IPv6 Multicast Profile Settings**, as show below:

The screenshot shows the 'IPv6 Multicast Profile Settings' window. At the top, there are fields for 'Profile ID (1-60)' and 'Profile Name', with a note '(Max: 32 characters)'. Below these are buttons for 'Add', 'Find', and 'Delete All'. A message 'Total Entries: 1' is displayed above a table. The table has columns for Profile ID and Profile Name. It lists one entry: Profile ID 1 with Profile Name PName. To the right of the table are buttons for 'Group List', 'Edit', and 'Delete'.

**Figure 4-99 IPv6 Multicast Profile Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID (1-60)</b>	Enter a Profile ID between 1 and 60.
<b>Profile Name</b>	Enter a name for the IP Multicast Profile.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

Click the [Group List](#) link to configure the multicast address group list settings for the specific entry.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

After clicking the [Group List](#) link, the following page will appear:

Multicast Address Group List Settings		Safeguard						
Profile ID	1							
Profile Name	PName							
Multicast Address List	<input type="text" value="FF1E::1-FF1E::2"/>	<b>Add</b>						
<b>&lt;&lt; Back</b>								
<b>Multicast Address Group List: 1</b> <table border="1"> <thead> <tr> <th>NO.</th> <th>Multicast Address List</th> <th></th> </tr> </thead> <tbody> <tr> <td>1</td> <td>FF1E::1</td> <td><b>Edit</b>    <b>Delete</b></td> </tr> </tbody> </table>			NO.	Multicast Address List		1	FF1E::1	<b>Edit</b> <b>Delete</b>
NO.	Multicast Address List							
1	FF1E::1	<b>Edit</b> <b>Delete</b>						

**Figure 4-100 Multicast Address Group List Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Multicast Address List</b>	Enter the multicast address list here.

Click the **Add** button to add a new entry based on the information entered.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## IPv6 Limited Multicast Range Settings

Users can configure the ports and VLANs on the Switch that will be involved in the Limited IPv6 Multicast Range.

To view the following window, click **L2 Features > Multicast Filtering > IPv6 Multicast Filtering > IPv6 Limited Multicast Range Settings**, as show below:

The screenshot shows the 'IPv6 Limited Multicast Range Settings' window. At the top, there are three sets of input fields for Ports, Access State (Permit), and Profile ID. Below these are three rows of table data showing VID, Access State, and Profile ID for VLANs 1, 2, and 4. A navigation bar at the bottom right includes '1/1', '1', and 'Go'.

VID	Access State	Profile ID
1	Permit	
2	Permit	
4	Permit	

Figure 4-101 IPv6 Limited Multicast Range Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Ports/VID List</b>	Select the appropriate port(s) or VLAN IDs used for the configuration here.
<b>Access</b>	Assign access permissions to the ports selected. Options listed are <i>Permit</i> and <i>Deny</i> .
<b>Profile ID/Profile Name</b>	Use the drop-down menu to select the profile ID or profile name used and then assign <i>Permit</i> or <i>Deny</i> access to them.

Click the **Apply** button to accept the changes made.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry.

Click the **Find** button to locate a specific entry based on the information entered.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## IPv6 Max Multicast Group Settings

Users can configure the ports and VLANs on the switch that will be a part of the maximum filter group, up to a maximum of 1024.

The screenshot shows the 'IPv6 Max Multicast Group Settings' window. At the top, there are two sets of input fields for Ports, Max Group (1-480), and Action (Drop). Below these are three rows of table data showing VID, Max Multicast Group Number, and Action for VLANs 1, 2, and 4. A navigation bar at the bottom right includes '1/1', '1', and 'Go'.

VID	Max Multicast Group Number	Action
1	Infinite	Drop
2	Infinite	Drop
4	Infinite	Drop

Figure 4-102 IPv6 Max Multicast Group Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Ports/VID List</b>	Select the appropriate port(s) or VLAN IDs used for the configuration here.
<b>Max Group</b>	If the checkbox <b>Infinite</b> is not selected, the user can enter a <b>Max Group</b> value.
<b>Infinite</b>	Tick the check box to enable or disable the use of the Infinite value.
<b>Action</b>	Use the drop-down menu to select the appropriate action for this rule. The user can select <i>Drop</i> to initiate the drop action or the user can select <i>Replace</i> to initiate the replace action.

Click the **Apply** button to accept the changes made.

Click the **Find** button to locate a specific entry based on the information entered.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## Multicast Filtering Mode

Users can configure the multicast filtering mode.

To view the following window, click **L2 Features > Multicast Filtering > Multicast Filtering Mode**, as show below:

The screenshot shows the 'Multicast Filtering Mode' configuration window. At the top, there are two radio buttons: 'VLAN Name' (selected) and 'VID List'. Below them is a search bar containing 'All' with a checked checkbox. To the right is a dropdown menu set to 'Forward Unregistered Groups' with an 'Apply' button next to it. Below this section, another pair of radio buttons shows 'VLAN Name' selected. A 'Find' button is located to the right of this section. The main area displays a table titled 'Total Entries: 4'. The table has three columns: 'VLAN ID', 'VLAN Name', and 'Multicast Filter Mode'. The data is as follows:

VLAN ID	VLAN Name	Multicast Filter Mode
1	default	Forward Unregistered Groups
2	PVLAN	Forward Unregistered Groups
3	MVLAN	Forward Unregistered Groups
4	M2VLAN	Forward Unregistered Groups

At the bottom right of the table are navigation buttons: '1/1', '1', an empty input field, and a 'Go' button.

Figure 4-103 Multicast Filtering Mode window

The fields that can be configured are described below:

Parameter	Description
<b>VLAN Name/VID List</b>	The VLAN to which the specified filtering action applies. Tick the <b>All</b> check box to apply this feature to all the VLANs.
<b>Multicast Filtering Mode</b>	This drop-down menu allows you to select the action the Switch will take when it receives a multicast packet that requires forwarding to a port in the specified VLAN. <i>Forward All Groups</i> – This will instruct the Switch to forward all multicast packets to the specified VLAN. <i>Forward Unregistered Groups</i> – The multicast packets whose destination is an unregistered multicast group will be forwarded within the range of ports specified above. <i>Filter Unregistered Groups</i> – The multicast packets whose destination is a registered multicast group will be forwarded within the range of ports specified above.

Click the **Apply** button to accept the changes made.

Click the **Find** button to locate a specific entry based on the information entered.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## ERPS Settings

Ethernet Ring Protection Switching (ERPS) is the first industry standard (ITU-T G.8032) for ERPS. ERPS provides sub-50ms protection for Ethernet traffic in a ring topology. It ensures that there are no loops formed at the Ethernet layer.

One link within a ring will be blocked to avoid Loop (RPL, Ring Protection Link). When the failure happens, protection switching blocks the failed link and unblocks the RPL. When the failure clears, protection switching blocks the RPL again and unblocks the link on which the failure is cleared.

### **G.8032 Terms and Concepts**

**RPL (Ring Protection Link)** – Link designated by mechanism that is blocked during Idle state to prevent loop on Bridged ring

**RPL Owner** – Node connected to RPL that blocks traffic on RPL during Idle state and unblocks during Protected state

**R-APS (Ring – Automatic Protection Switching)** – A feature defined in Y.1731 and G.8032 used to coordinate the protection actions over the ring through RAPS VLAN (R-APS Channel).

**RAPS VLAN (R-APS Channel)** – A separate ring-wide VLAN for transmission of R-APS messages

**Protected VLAN** – The service traffic VLANs for transmission of normal network traffic

This page is used to enable the ERPS function on the switch.

**NOTE:** STP and LBD should be disabled on the ring ports before enabling ERPS. The ERPS cannot be enabled before the R-APS VLAN is created, and ring ports, RPL port, RPL owner, are configured.

To view the following window, click **L2 Features > ERPS Settings**, as show below:

The screenshot shows the 'ERPS Settings' window with the following sections:

- ERPS Global Settings:** Contains three pairs of radio buttons for 'ERPS State', 'ERPS Log', and 'ERPS Trap', each with 'Enabled' and 'Disabled' options. An 'Apply' button is located to the right of the trap settings.
- R-APS VLAN Settings:** Contains a text input field for 'R-APS VLAN (1-4094)', and 'Apply' and 'Find' buttons to its right. Below this is a 'View All' button.
- Total Entries: 1**: A table header showing one entry.
- R-APS VLAN**: A table row with columns for '1' (entry index), 'Detail Information', 'Sub-Ring Information', and 'Delete'. To the right of the table are buttons for '1/1', '1', and 'Go'.

Figure 4-104 ERPS Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>ERPS State</b>	Here the user can enable or disable the ERPS State.
<b>ERPS Log</b>	Here the user can enable or disable the ERPS Log.

<b>ERPS Trap</b>	Here the user can enable or disable the ERPS Trap.
<b>R-APS VLAN (1-4094)</b>	Specifies the VLAN which will be the R-APS VLAN.

Click the **Apply** button to accept the changes made.

Click the **Find** button to find a specific entry based on the information entered.

Click the **View All** button to view all the entries configured.

Click the **Delete** button to remove the specific entry.

Click the [Detail Information](#) link to view detailed information of the R-APS entry.

Click the [Sub-Ring Information](#) link to view the Sub-Ring information of the R-APS entry.

After clicking the [Detail Information](#) link, the following window will appear:

ERPS Information		
R-APS VLAN	1	
Ring Status	Disabled	
Admin West Port		
Operational West Port		
Admin East Port		
Operational East Port		
Admin RPL Port	None	
Operational RPL Port	None	
Admin RPL Owner	Disabled	
Operational RPL Owner	Disabled	
Protected VLAN(s)		
Ring MEL (0-7)	1	
Holdoff Time (0-10000)	0	ms
Guard Time (10-2000)	500	ms
WTR Time (5-12)	5	min
Revertive	Enabled	
Current Ring State	-	

[Edit](#)    [<< Back](#)

Click the **Edit** button to re-configure the specific entry.

Click the **<< Back** button to return to the ERPS settings page.

After click the **Edit** button, the following window will appear:

The screenshot shows the 'ERPS Settings' page with various configuration parameters for the R-APS function. Key fields include:

- R-APS VLAN:** Set to 1.
- Ring Status:** Set to Disabled.
- Admin West Port:** Set to Unit 1, Virtual Channel.
- Operational West Port:** Not explicitly set.
- Admin East Port:** Set to Unit 1, Virtual Channel.
- Operational East Port:** Not explicitly set.
- Admin RPL Port:** Set to None.
- Operational RPL Port:** Set to None.
- Admin RPL Owner:** Set to Disabled.
- Operational RPL Owner:** Set to Disabled.
- Protected VLAN(s) (e.g.: 4-6):** A field for entering protected VLAN ranges, currently empty.
- Ring MEL (0-7):** Set to 1.
- Holdoff Time (0-10000):** Set to 0 ms.
- Guard Time (10-2000):** Set to 500 ms.
- WTR Time (5-12):** Set to 5 min.
- Revertive:** Set to Enabled.
- Current Ring State:** Set to -.

Buttons at the bottom include 'Apply' and '< < Back'.

The fields that can be configured or displayed are described below:

Parameter	Description
<b>R-APS VLAN</b>	Display the R-APS VLAN ID.
<b>Ring Status</b>	Tick the check box and use the drop-down menu to enable or disable the specified ring.
<b>Admin West Port</b>	Tick the check box and use the drop-down menu to specify the port as the west ring port and also the virtual port channel used. Select the <b>Unit</b> you wish to configure.
<b>Operational West Port</b>	The operational west port value is displayed.
<b>Admin East Port</b>	Tick the check box and use the drop-down menu to specify the port as the east ring port and also the virtual port channel used. Select the <b>Unit</b> you wish to configure.
<b>Operational East Port</b>	Display the operational east port value.
<b>Admin RPL Port</b>	Tick the check box and use the drop-down menu to specify the RPL port used. Options to choose from are <i>West Port</i> , <i>East Port</i> , and <i>None</i> .
<b>Operational RPL Port</b>	Display the operational RPL port value.
<b>Admin RPL Owner</b>	Tick the check box and use the drop-down menu to enable or disable the RPL owner node.
<b>Operational RPL Owner</b>	Display the operational RPL owner value.
<b>Protected VLAN(s)</b>	Tick the check box, click the <b>Add</b> or <b>Delete</b> radio button, and enter the protected VLAN group.
<b>Ring MEL (0-7)</b>	Tick the check box and enter the ring MEL of the R-APS function. The default ring MEL is 1.
<b>Holdoff Time (0-10000)</b>	Tick the check box and enter the hold-off time of the R-APS function. The default hold-off time is 0 milliseconds.
<b>Guard Time (10-2000)</b>	Tick the check box and enter the guard time of the R-APS function. The default guard

	time is 500 milliseconds.
<b>WTR Time (5-12)</b>	Tick the check box and enter the WTR time of the R-APS function.
<b>Revertive</b>	Tick the check box and use the drop-down menu to enable or disable the state of the R-APS revertive option.
<b>Current Ring State</b>	Display the current Ring state.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to return to the previous window.

After clicking the [Sub-Ring Information](#) link, the following window will appear:

The screenshot shows the 'ERPS Sub-Ring Settings' configuration page. It includes fields for R-APS VLAN (set to 1), Sub-Ring R-APS VLAN (1-4094) (set to 1), State (Add selected), and TC Propagation State (Disabled selected). At the bottom, there are 'Apply' and '<<Back' buttons. A message 'Total Entries: 0' is displayed above the buttons.

The fields that can be configured are described below:

Parameter	Description
<b>Sub-Ring R-APS VLAN (1-4094)</b>	Enter the Sub-Ring R-APS VLAN ID used here.
<b>State</b>	Tick the check box and use the drop-down menu to add or delete the ERPS Sub-Ring state.
<b>TC Propagation State</b>	Tick the check box and use the drop-down menu to enable or disable the TC Propagation state.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to return to the previous window.

## LLDP

The Link Layer Discovery Protocol (LLDP) allows stations attached to an IEEE 802 LAN to advertise, to other stations attached to the same IEEE 802 LAN. The major capabilities provided by this system is that it incorporates the station, the management address or addresses of the entity or entities that provide management of those capabilities, and the identification of the station's point of attachment to the IEEE 802 LAN required by those management entity or entities.

The information distributed via this protocol is stored by its recipients in a standard Management Information Base (MIB), making it possible for the information to be accessed by a Network Management System (NMS) through a management protocol such as the Simple Network Management Protocol (SNMP).

## LLDP

## LLDP Global Settings

On this page the user can configure the LLDP global parameters.

To view the following window, click **L2 Features > LLDP > LLDP> LLDP Global Settings**, as show below:

The screenshot shows the 'LLDP Global Settings' window. At the top, there are two sections: 'LLDP State' (radio buttons for Enabled or Disabled) and 'LLDP Forward Message' (radio buttons for Enabled or Disabled), each with an 'Apply' button. Below these are five input fields for time intervals: 'Message TX Interval (5-32768)' set to 30 sec, 'Message TX Hold Multiplier (2-10)' set to 4, 'LLDP ReInit Delay (1-10)' set to 2 sec, 'LLDP TX Delay (1-8192)' set to 2 sec, and 'LLDP Notification Interval (5-3600)' set to 5 sec, also each with an 'Apply' button. At the bottom, there is a 'LLDP System Information' section listing chassis details: Chassis ID Subtype (MAC Address), Chassis ID (00-01-02-03-04-00), System Name, System Description (Gigabit Ethernet Switch), and System Capabilities (Repeater, Bridge).

**Figure 4-105 LLDP Global Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>LLDP State</b>	Click the radio buttons to enable or disable the LLDP feature.
<b>LLDP Forward Message</b>	When LLDP is disabled this function controls the LLDP packet forwarding message based on individual ports. If LLDP is enabled on a port it will flood the LLDP packet to all ports that have the same port VLAN and will advertise to other stations attached to the same IEEE 802 LAN.
<b>Message TX Interval (5-32768)</b>	This interval controls how often active ports retransmit advertisements to their neighbors. To change the packet transmission interval, enter a value between 5 and 35768 seconds.
<b>Message TX Hold Multiplier (2-10)</b>	This function calculates the Time-to-Live for creating and transmitting the LLDP advertisements to LLDP neighbors by changing the multiplier used by an LLDP Switch. When the Time-to-Live for an advertisement expires the advertised data is then deleted from the neighbor Switch's MIB.
<b>LLDP ReInit Delay (1-10)</b>	The LLDP re-initialization delay interval is the minimum time that an LLDP port will wait before reinitializing after receiving an LLDP disable command. To change the LLDP re-init delay, enter a value between 1 and 10 seconds.
<b>LLDP TX Delay (1-8192)</b>	LLDP TX Delay allows the user to change the minimum time delay interval for any LLDP port which will delay advertising any successive LLDP advertisements due to change in the LLDP MIB content. To change the LLDP TX Delay, enter a value between 1 and 8192 seconds.
<b>LLDP Notification Interval (5-3600)</b>	LLDP Notification Interval is used to send notifications to configured SNMP trap receiver(s) when an LLDP change is detected in an advertisement received on the port from an LLDP neighbor. To set the LLDP Notification Interval, enter a value between 5 and 3600 seconds.

Click the **Apply** button to accept the changes made for each individual section.

## LLDP Port Settings

On this page the user can configure the LLDP port parameters.

To view the following window, click **L2 Features > LLDP > LLDP> LLDP Port Settings**, as show below:

The screenshot shows the 'LLDP Port Settings' configuration window. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), 'To Port' (set to 01), 'Notification' (set to 'Disabled'), and 'Admin Status' (set to 'TX and RX'). Below these are dropdowns for 'Subtype' (set to 'IPv4') and 'Action' (set to 'Disabled'). A note states: 'Note: The IPv4 (IPv6) address should be the switch's address.' An 'Apply' button is present. The main area displays 'Unit 1 Settings' for 24 ports, all of which have 'Notification' set to 'Disabled' and 'Admin Status' set to 'TX and RX'. The IPv4 (IPv6) Address column is empty for all ports.

Port ID	Notification	Admin Status	IPv4 (IPv6) Address
1	Disabled	TX and RX	
2	Disabled	TX and RX	
3	Disabled	TX and RX	
4	Disabled	TX and RX	
5	Disabled	TX and RX	
6	Disabled	TX and RX	
7	Disabled	TX and RX	
8	Disabled	TX and RX	
9	Disabled	TX and RX	
10	Disabled	TX and RX	
11	Disabled	TX and RX	
12	Disabled	TX and RX	
13	Disabled	TX and RX	
14	Disabled	TX and RX	
15	Disabled	TX and RX	
16	Disabled	TX and RX	
17	Disabled	TX and RX	
18	Disabled	TX and RX	
19	Disabled	TX and RX	
20	Disabled	TX and RX	
21	Disabled	TX and RX	
22	Disabled	TX and RX	
23	Disabled	TX and RX	
24	Disabled	TX and RX	

Figure 4-106 LLDP Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menu to select the starting and ending ports to use.
<b>Notification</b>	Use the drop-down menu to enable or disable the status of the LLDP notification. This function controls the SNMP trap however it cannot implement traps on SNMP when the notification is disabled.
<b>Admin Status</b>	This function controls the local LLDP agent and allows it to send and receive LLDP frames on the ports. This option contains <i>TX</i> , <i>RX</i> , <i>TX And RX</i> or <i>Disabled</i> . <i>TX</i> - the local LLDP agent can only transmit LLDP frames. <i>RX</i> - the local LLDP agent can only receive LLDP frames. <i>TX And RX</i> - the local LLDP agent can both transmit and receive LLDP frames.

	<i>Disabled</i> - the local LLDP agent can neither transmit nor receive LLDP frames. The default value is TX And RX.
<b>Subtype</b>	Use the drop-down menu to select the type of the IP address information will be sent.
<b>Action</b>	Use the drop-down menu to enable or disable the action field.
<b>Address</b>	Enter the IP address that will be sent.

Click the **Apply** button to accept the changes made.

**NOTE:** The IPv4 or IPv6 address entered here should be an existing LLDP management IP address.

## LLDP Management Address List

On this page the user can view the LLDP management address list.

To view the following window, click **L2 Features > LLDP > LLDP> LLDP management Address List**, as show below:

LLDP Management Address List				
Subtype	Address	IF Type	OID	Advertising Ports
IPv4	System(10.90.90.90)	IfIndex	1.3.6.1.4.1.171.10.1...	
IPv4	10.90.90.90	IfIndex	1.3.6.1.4.1.171.10.1...	

Figure 4-107 LLDP Management Address List window

The fields that can be configured are described below:

Parameter	Description
<b>IPv4/IPv6</b>	Use the drop-down menu to select either IPv4 or IPv6.
<b>Address</b>	Enter the management IP address or the IP address of the entity you wish to advertise to. The IPv4 address is a management IP address, so the IP information will be sent with the frame.

Click the **Find** button to locate a specific entry based on the information entered.

## LLDP Basic TLVs Settings

TLV stands for Type-length-value, which allows the specific sending information as a TLV element within LLDP packets. This window is used to enable the settings for the Basic TLVs Settings. An active LLDP port on the Switch always included mandatory data in its outbound advertisements. There are four optional data types that can be configured for an individual port or group of ports to exclude one or more of these data types from outbound LLDP advertisements. The mandatory data type includes four basic types of information (end of LLDPDU TLV, chassis ID TLV, port ID TLV, and Time to Live TLV). The mandatory data types cannot be disabled. There are also four data types which can be optionally selected. These include Port Description, System Name, System Description and System Capability.

To view the following window, click **L2 Features > LLDP > LLDP> LLDP Basic TLVs Settings**, as show below:

The screenshot shows the 'LLDP Basic TLVs Settings' window. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), and 'To Port' (set to 01). Below these are four dropdowns: 'Port Description' (disabled), 'System Name' (disabled), 'System Description' (disabled), and 'System Capabilities' (disabled). An 'Apply' button is located to the right of the dropdowns. Below this section is a table titled 'Unit 1 Settings' with 10 rows, each representing a port from 1 to 10. All ports have their respective 'Port Description', 'System Name', 'System Description', and 'System Capabilities' set to 'Disabled'.

Unit 1 Settings				
Port	Port Description	System Name	System Description	System Capabilities
1	Disabled	Disabled	Disabled	Disabled
2	Disabled	Disabled	Disabled	Disabled
3	Disabled	Disabled	Disabled	Disabled
4	Disabled	Disabled	Disabled	Disabled
5	Disabled	Disabled	Disabled	Disabled
6	Disabled	Disabled	Disabled	Disabled
7	Disabled	Disabled	Disabled	Disabled
8	Disabled	Disabled	Disabled	Disabled
9	Disabled	Disabled	Disabled	Disabled
10	Disabled	Disabled	Disabled	Disabled

Figure 4-108 LLDP Basic TLVs Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the port range to use for this configuration.
<b>Port Description</b>	Use the drop-down menu to enable or disable the Port Description option.
<b>System Name</b>	Use the drop-down menu to enable or disable the System Name option.
<b>System Description</b>	Use the drop-down menu to enable or disable the System Description option.
<b>System Capabilities</b>	Use the drop-down menu to enable or disable the System Capabilities option.

Click the **Apply** button to accept the changes made.

## LLDP Dot1 TLVs Settings

LLDP Dot1 TLVs are organizationally specific TLVs which are defined in IEEE 802.1 and used to configure an individual port or group of ports to exclude one or more of the IEEE 802.1 organizational port VLAN ID TLV data types from outbound LLDP advertisements.

To view the following window, click **L2 Features > LLDP > LLDP> LLDP Dot1 TLVs Settings**, as show below:

**LLDP Dot1 TLVs Settings**

Unit	1	From Port	01	To Port	01
Dot1 TLV PVID	Disabled				
Dot1 TLV Protocol VLAN	Disabled	VLAN Name			
Dot1 TLV VLAN	Disabled	VLAN Name			
Dot1 TLV Protocol Identity	Disabled	EAPOL			
<input type="button" value="Apply"/>					

**Unit 1 Settings**

Port	PVID State	Port and Protocol VID State	VID	VLAN Name State	VID	Protocol Identity State	Protocol Identity
1	Disabled	Disabled		Disabled		Disabled	
2	Disabled	Disabled		Disabled		Disabled	
3	Disabled	Disabled		Disabled		Disabled	
4	Disabled	Disabled		Disabled		Disabled	
5	Disabled	Disabled		Disabled		Disabled	
6	Disabled	Disabled		Disabled		Disabled	
7	Disabled	Disabled		Disabled		Disabled	
8	Disabled	Disabled		Disabled		Disabled	
9	Disabled	Disabled		Disabled		Disabled	
10	Disabled	Disabled		Disabled		Disabled	
11	Disabled	Disabled		Disabled		Disabled	
12	Disabled	Disabled		Disabled		Disabled	
13	Disabled	Disabled		Disabled		Disabled	
14	Disabled	Disabled		Disabled		Disabled	
15	Disabled	Disabled		Disabled		Disabled	
16	Disabled	Disabled		Disabled		Disabled	
17	Disabled	Disabled		Disabled		Disabled

19	Disabled	Disabled		Disabled		Disabled	

**Figure 4-109 LLDP Dot1 TLVs Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the port range to use for this configuration.
<b>Dot1 TLV PVID</b>	Use the drop-down menu to enable or disable and configure the Dot1 TLV PVID option.
<b>Dot1 TLV Protocol VLAN</b>	Use the drop-down menu to enable or disable, and configure the Dot1 TLV Protocol VLAN option. After enabling this option, the user can select to use either <i>VLAN Name</i> , <i>VLAN ID</i> or <i>All</i> in the next drop-down menu. After selecting this, the user can enter either the VLAN name or VLAN ID in the space provided.
<b>Dot1 TLV VLAN</b>	Use the drop-down menu to enable or disable, and configure the Dot1 TLV VLAN option. After enabling this option, the user can select to use either <i>VLAN Name</i> , <i>VLAN ID</i> or <i>All</i> in the next drop-down menu. After selecting this, the user can enter either the VLAN name or VLAN ID in the space provided.
<b>Dot1 TLV Protocol Identity</b>	Use the drop-down menu to enable or disable, and configure the Dot1 TLV Protocol Identity option. After enabling this option the user can select to either use <i>EAPOL</i> , <i>LACP</i> , <i>GVRP</i> , <i>STP</i> , or <i>All</i> .

Click the **Apply** button to accept the changes made.

## LLDP Dot3 TLVs Settings

This window is used to configure an individual port or group of ports to exclude one or more IEEE 802.3 organizational specific TLV data type from outbound LLDP advertisements.

To view the following window, click **L2 Features > LLDP > LLDP> LLDP Dot3 TLVs Settings**, as show below:

The screenshot shows the 'LLDP Dot3 TLVs Settings' window. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), and 'To Port' (set to 01). Below these are two rows of configuration options: 'MAC / PHY Configuration Status' (disabled) and 'Link Aggregation' (disabled), followed by 'Maximum Frame Size' (disabled) and 'Power Via MDI' (disabled). A 'Safeguard' button is in the top right corner. Below these controls is a large table titled 'Unit 1 Settings' containing 22 rows, each representing a port from 1 to 22. Each row has five columns: Port, MAC / PHY Configuration Status, Link Aggregation, Maximum Frame Size, and Power Via MDI, all of which are set to 'Disabled'.

Unit 1 Settings				
Port	MAC / PHY Configuration Status	Link Aggregation	Maximum Frame Size	Power Via MDI
1	Disabled	Disabled	Disabled	Disabled
2	Disabled	Disabled	Disabled	Disabled
3	Disabled	Disabled	Disabled	Disabled
4	Disabled	Disabled	Disabled	Disabled
5	Disabled	Disabled	Disabled	Disabled
6	Disabled	Disabled	Disabled	Disabled
7	Disabled	Disabled	Disabled	Disabled
8	Disabled	Disabled	Disabled	Disabled
9	Disabled	Disabled	Disabled	Disabled
10	Disabled	Disabled	Disabled	Disabled
11	Disabled	Disabled	Disabled	Disabled
12	Disabled	Disabled	Disabled	Disabled
13	Disabled	Disabled	Disabled	Disabled
14	Disabled	Disabled	Disabled	Disabled
15	Disabled	Disabled	Disabled	Disabled
16	Disabled	Disabled	Disabled	Disabled
17	Disabled	Disabled	Disabled	Disabled
18	Disabled	Disabled	Disabled	Disabled
19	Disabled	Disabled	Disabled	Disabled
20	Disabled	Disabled	Disabled	Disabled
21	Disabled	Disabled	Disabled	Disabled
22	Disabled	Disabled	Disabled	Disabled

Figure 4-110 LLDP Dot3 TLVs Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the port range to use for this configuration.
<b>MAC / PHY Configuration Status</b>	This TLV optional data type indicates that the LLDP agent should transmit the MAC/PHY configuration/status TLV. This indicates it is possible for two ends of an IEEE 802.3 link to be configured with different duplex and/or speed settings and still establish some limited network connectivity. More precisely, the information includes whether the port supports the auto-negotiation function, whether the function is enabled, whether it has auto-negotiated advertised capability, and what is the operational MAU type. The default state is Disabled.
<b>Link Aggregation</b>	The Link Aggregation option indicates that LLDP agents should transmit 'Link Aggregation TLV'. This indicates the current link aggregation status of IEEE 802.3 MACs. More precisely, the information should include whether the port is capable of doing link aggregation, whether the port is aggregated in an aggregated link, and what

	is the aggregated port ID. The default state is Disabled.
<b>Maximum Frame Size</b>	The Maximum Frame Size indicates that LLDP agent should transmit 'Maximum-frame-size TLV. The default state is Disabled.
<b>Power Via MDI</b>	Use the drop down menu to specify whether LLDP agent should transmit Power via MDI TLV. Three IEEE 802.3 PMD implementations (10BASE-T, 100BASE-TX, and 1000BASE-T) allow power to be supplied over the link for connected non-powered systems. The Power Via MDI TLV allows network management to advertise and discover the MDI power support capabilities of the sending IEEE 802.3 LAN station. The default state is Disabled.

Click the **Apply** button to accept the changes made.

## LLDP Statistic System

The LLDP Statistics System page allows you an overview of the neighbor detection activity, LLDP Statistics and the settings for individual ports on the Switch. To view the following window, click **L2 Features > LLDP > LLDP> LLDP Statistic System**, as show below:

**LLDP Statistics System**

**LLDP Statistics**

Last Change Time	0
Number of Table Insert	0
Number of Table Delete	0
Number of Table Drop	0
Number of Table Ageout	0

Total TX Frames	0
Total Discarded RX Frames	0
RX Errors Frames	0
Total RX Frames	0
Total Discarded RX TLVs	0
Total Unrecognized RX TLVs	0
Total Aged out Neighbor Information	0

Figure 4-111 LLDP Statistics System window

Select a **Unit** and **Port** number from the drop-down menu and click the **Find** button to view statistics for a certain port.

## LLDP Local Port Information

The LLDP Local Port Information page displays the information on a per port basis currently available for populating outbound LLDP advertisements in the local port brief table shown below.

To view the following window, click **L2 Features > LLDP > LLDP> LLDP Local Port Information**, as show below:

The screenshot shows the 'LLDP Local Port Information' window with the title bar 'LLDP Local Port Information' and a 'Safeguard' button. A dropdown menu 'Unit' is set to '1'. A 'Show Normal' button is located in the top right corner. The main area displays a table titled 'LLDP Local Port Brief Table' with four columns: 'Port', 'Port ID Subtype', 'Port ID', and 'Port Description'. The table lists 24 entries, each corresponding to a port from 1:1 to 1:24, all identified as MAC Address with a value of '00-01-02-03-05-XX' and a description of 'D-Link DGS-3420...'. The table has scroll bars on the right side.

Port	Port ID Subtype	Port ID	Port Description
1:1	MAC Address	00-01-02-03-05-00	D-Link DGS-3420...
1:2	MAC Address	00-01-02-03-05-01	D-Link DGS-3420...
1:3	MAC Address	00-01-02-03-05-02	D-Link DGS-3420...
1:4	MAC Address	00-01-02-03-05-03	D-Link DGS-3420...
1:5	MAC Address	00-01-02-03-05-04	D-Link DGS-3420...
1:6	MAC Address	00-01-02-03-05-05	D-Link DGS-3420...
1:7	MAC Address	00-01-02-03-05-06	D-Link DGS-3420...
1:8	MAC Address	00-01-02-03-05-07	D-Link DGS-3420...
1:9	MAC Address	00-01-02-03-05-08	D-Link DGS-3420...
1:10	MAC Address	00-01-02-03-05-09	D-Link DGS-3420...
1:11	MAC Address	00-01-02-03-05-0A	D-Link DGS-3420...
1:12	MAC Address	00-01-02-03-05-0B	D-Link DGS-3420...
1:13	MAC Address	00-01-02-03-05-0C	D-Link DGS-3420...
1:14	MAC Address	00-01-02-03-05-0D	D-Link DGS-3420...
1:15	MAC Address	00-01-02-03-05-0E	D-Link DGS-3420...
1:16	MAC Address	00-01-02-03-05-0F	D-Link DGS-3420...
1:17	MAC Address	00-01-02-03-05-10	D-Link DGS-3420...
1:18	MAC Address	00-01-02-03-05-11	D-Link DGS-3420...
1:19	MAC Address	00-01-02-03-05-12	D-Link DGS-3420...
1:20	MAC Address	00-01-02-03-05-13	D-Link DGS-3420...
1:21	MAC Address	00-01-02-03-05-14	D-Link DGS-3420...
1:22	MAC Address	00-01-02-03-05-15	D-Link DGS-3420...
1:23	MAC Address	00-01-02-03-05-16	D-Link DGS-3420...
1:24	MAC Address	00-01-02-03-05-17	D-Link DGS-3420...

Figure 4-112 LLDP Local Port Information window

To view the normal LLDP Local Port information page per port, click the **Show Normal** button.

To view the brief LLDP Local Port information page per port, click the **Show Brief** button.

The screenshot shows the 'LLDP Local Port Information' window with the title bar 'LLDP Local Port Information' and a 'Safeguard' button. A dropdown menu 'Unit' is set to '1' and 'Port' is set to '01'. A 'Find' and 'Show Brief' button are located in the top right corner. The main area displays a table titled 'LLDP Normal Ports' with two columns: 'Port ID Subtype' and 'Port Description'. The table lists various port-related parameters for Port 01, such as MAC Address, Port ID, Port Description (D-Link DGS-3420-28SC R1.50.010 Port 1 on Unit 1), Port PVID (1), Management Address Count (with a 'Show Detail' link), PPVID Entries (with a 'Show Detail' link), VLAN Entries (with a 'Show Detail' link), Protocol Identity Entries Count (with a 'Show Detail' link), MAC / PHY Configuration/Status (with a 'Show Detail' link), Link Aggregation (with a 'Show Detail' link), and Maximum Frame Size (1536).

LLDP Normal Ports	
Port ID Subtype	MAC Address
Port ID	00-01-02-03-05-00

## LLDP-MED

### LLDP-MED System Settings

This window is used to configure the LLDP-MED log state and the fast start repeat count, and display the LLDP-MED system information.

To view the following window, click **L2 Features > LLDP> LLDP-MED > LLDP-MED System Settings**, as show below:

The screenshot shows the 'LLDP-MED System Settings' window. At the top, there's a 'Safeguard' button. Below it, the 'LLDP-MED Log State' section has two radio buttons: 'Enabled' (unchecked) and 'Disabled' (checked). To the right is an 'Apply' button. Underneath is a 'Fast Start Repeat Count (1-10)' input field containing '4', with another 'Apply' button to its right. The main area is titled 'LLDP-MED System Information' and lists various device details:

Device Class	Network Connectivity Device
Hardware Revision	B1
Firmware Revision	1.00.003
Software Revision	1.50.010
Serial Number	
Manufacturer Name	D-Link
Model Name	DGS-3420-28SC Gigabit Ethernet S
Asset ID	
PoE Device Type	PSE Device
PoE PSE Power Source	Primary

Figure 4-117 LLDP-MED System Settings window

The fields that can be configured are described below:

Parameter	Description
<b>LLDP-MED Log State</b>	Click the radio buttons to enable or disable the log state of LLDP-MED events.
<b>Fast Start Repeat Count (1-10)</b>	Enter a value between 1 and 10 for the fast start repeat count. When an LLDP-MED Capabilities TLV is detected for an MSAP identifier not associated with an existing LLDP remote system MIB, then the application layer shall start the fast start mechanism and set the 'medFastStart' timer to 'medFastStartRepeatCount' times 1. The default value is 4.

Click the **Apply** button to accept the changes made for each individual section.

## LLDP-MED Port Settings

This window is used to enable or disable transmitting LLDP-MED TLVs.

To view the following window, click **L2 Features > LLDP > LLDP-MED > LLDP-MED Port Settings**, as shown below:

The screenshot shows the 'LLDP-MED Port Settings' window. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), and 'To Port' (set to 01). Below these are dropdown menus for 'NTCS' (set to 'Disabled') and 'State' (set to 'Disabled'). To the right of these dropdowns are several checkboxes: 'Capabilities', 'Network Policy', 'Power Pse', 'Inventory', and 'All'. An 'Apply' button is located at the bottom right of the header area.

**Note:** NTCS: Notification Topology Change Status

**Unit 1 Settings**

Port	NTCS	Capabilities	Network Policy	Power Pse	Inventory
1	Disabled	Disabled	Disabled	Disabled	Disabled
2	Disabled	Disabled	Disabled	Disabled	Disabled
3	Disabled	Disabled	Disabled	Disabled	Disabled
4	Disabled	Disabled	Disabled	Disabled	Disabled
5	Disabled	Disabled	Disabled	Disabled	Disabled
6	Disabled	Disabled	Disabled	Disabled	Disabled
7	Disabled	Disabled	Disabled	Disabled	Disabled
8	Disabled	Disabled	Disabled	Disabled	Disabled
9	Disabled	Disabled	Disabled	Disabled	Disabled
10	Disabled	Disabled	Disabled	Disabled	Disabled
11	Disabled	Disabled	Disabled	Disabled	Disabled
12	Disabled	Disabled	Disabled	Disabled	Disabled
13	Disabled	Disabled	Disabled	Disabled	Disabled
14	Disabled	Disabled	Disabled	Disabled	Disabled
15	Disabled	Disabled	Disabled	Disabled	Disabled
16	Disabled	Disabled	Disabled	Disabled	Disabled
17	Disabled	Disabled	Disabled	Disabled	Disabled
18	Disabled	Disabled	Disabled	Disabled	Disabled
19	Disabled	Disabled	Disabled	Disabled	Disabled
20	Disabled	Disabled	Disabled	Disabled	Disabled
21	Disabled	Disabled	Disabled	Disabled	Disabled
22	Disabled	Disabled	Disabled	Disabled	Disabled

Figure 4-118 LLDP-MED Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the port range to use for this configuration.
<b>NTCS</b>	Use the drop-down menu to enable or disable Notification Topology Change Status.
<b>State</b>	Use the drop-down menu to enable or disable transmit LLDP-MED TLVs, and tick the check boxes of the TLV types that the LLDP agent should transmit. TLV types are <b>Capabilities</b> , <b>Network Policy</b> , <b>Power Pse</b> , and <b>Inventory</b> . Tick the <b>All</b> check box to select all TLV types.

Click the **Apply** button to accept the changes made.

## LLDP-MED Local Port Information

This window displays the per-port information currently available for populating outbound LLDP-MED advertisements. To view the following window, click **L2 Features > LLDP > LLDP-MED > LLDP-MED Local Port Information**, as shown below:

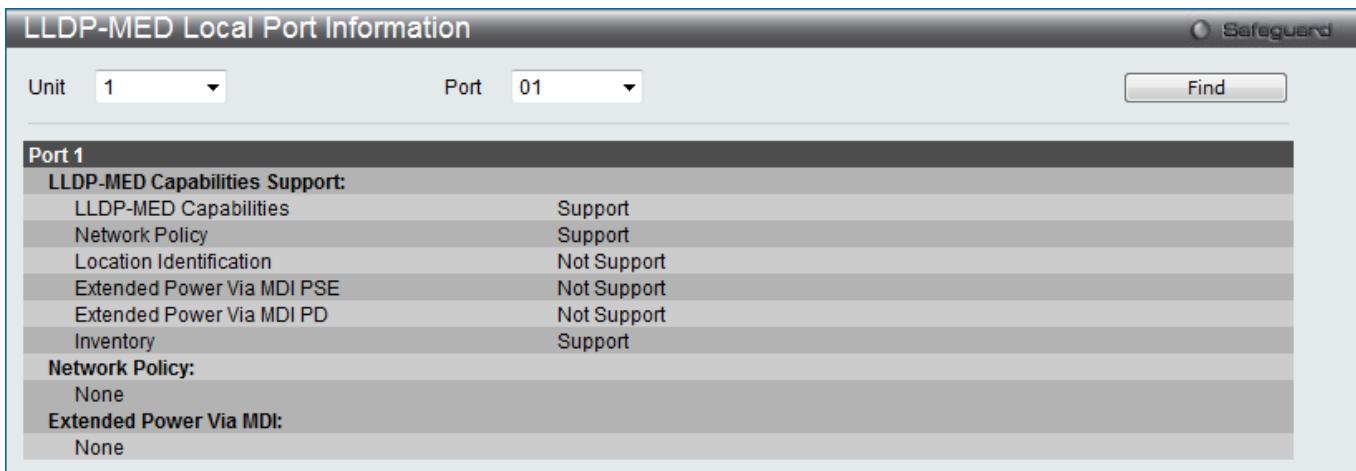

Figure 4-119 LLDP-MED Local Port Information window

Select a **Unit** and **Port** number from the drop-down menu and click the **Find** button to view statistics for a certain port.

## LLDP-MED Remote Port Information

This window displays the information learned from the neighbor parameters.

To view the following window, click **L2 Features > LLDP > LLDP-MED > LLDP-MED Remote Port Information**, as shown below:

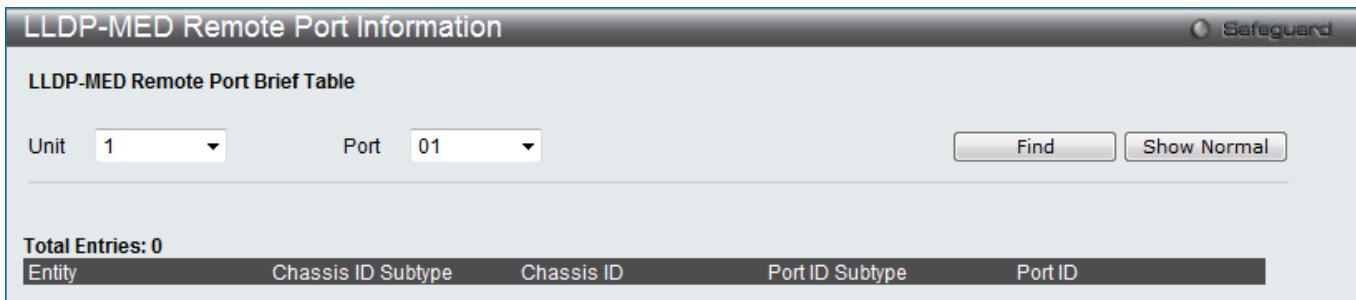

Figure 4-120 LLDP-MED Remote Port Information window

Select a **Unit** and **Port** number from the drop-down menu and click the **Find** button to view statistics for a certain port.

To view the normal LLDP Remote Port information page per port, click the **Show Normal** button.

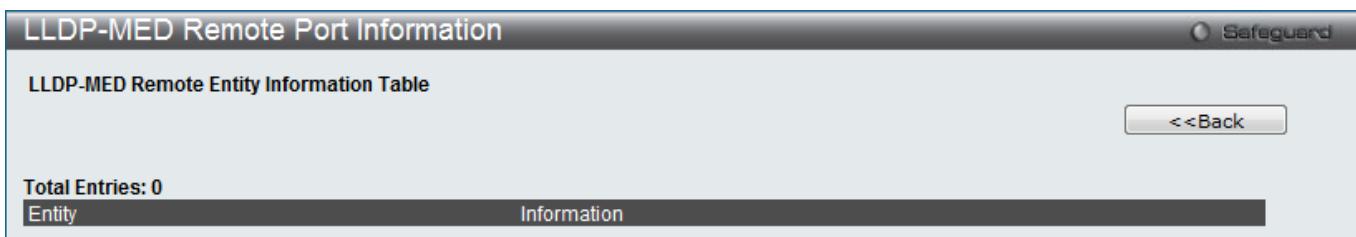

Figure 4-121 LLDP-MED Remote Port Information – Show Normal window

Click the **<<Back** button to return to the previous page.

## NLB FDB Settings

The Switch supports Network Load Balancing (NLB). This is a MAC forwarding control for supporting the Microsoft server load balancing application where multiple servers can share the same IP address and MAC address. The requests from clients will be forwarded to all servers, but will only be processed by one of them. In multicast mode, the client uses a multicast MAC address as the destination MAC to reach the server. Regardless of the mode, the destination MAC is the shared MAC. The server uses its own MAC address (rather than the shared MAC) as the source MAC address of the reply packet. The NLB multicast FDB entry will be mutually exclusive with the L2 multicast entry.

To view this window, click **L2 Features > NLB FDB Settings**, as shown below:

The screenshot shows the 'NLB FDB Settings' window. At the top left is the title 'NLB FDB Settings'. On the right is a 'Safeguard' button. Below the title are four radio buttons: 'Unicast' (selected), 'Multicast', 'VLAN Name', and 'VID (1-4094)'. To the right of 'VLAN Name' is a text input field '(Max: 32 characters)'. Below these are three text input fields: 'MAC Address', 'Unit' (set to 1), and a dropdown menu with options 1 through 26. To the right of the dropdown are 'Clear All' and 'Apply' buttons. Below this is a table with columns 'Port' and numbers 01 to 26. Under 'None' in the first row, there are buttons for 'All' and individual ports 01-26. Under 'Egress' in the second row, there are buttons for 'All' and individual ports 01-26. Below the table is a section labeled 'Egress Ports'. At the bottom left is 'Total Entries: 0'. Below that are three buttons: 'MAC Address', 'VID', and 'Egress Ports'.

**Figure 4-122 NLB FDB Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Unicast</b>	Click to create an NLB unicast FDB entry.
<b>Multicast</b>	Click to create an NLB multicast FDB entry.
<b>VLAN Name</b>	Click the radio button and enter the VLAN name of the NLB multicast FDB entry to be created.
<b>VID (1-4094)</b>	Click the radio button and enter the VLAN by the VLAN ID.
<b>MAC Address</b>	Enter the MAC address of the NLB multicast or unicast FDB entry to be created.
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Choose the forwarding ports for the specified NLB multicast FDB entry. <i>None</i> – The port is not the forwarding port. Click the <b>All</b> button to select all the ports. <i>Egress</i> - The port is the forwarding port. Click the <b>All</b> button to select all the ports.

Click the **Clear All** button to clear out all the information entered.

Click the **Apply** button to accept the changes made.

## PTP

The Precision Time Protocol (PTP) system is able to synchronize the distributed clocks with an accuracy of less than 1 microsecond via Ethernet networks for the very first time.

PTP is a technology that enables precise synchronization of clocks in systems. PTP is applicable to systems communicating by local area networks supporting multicast messaging including Ethernet and UDP. PTP enables heterogeneous systems that include clocks of various inherent precision, resolution and stability to synchronize to a grandmaster clock.

The synchronization is divided into two processes. The Best Master Clock (BMC) algorithm determines the PTP status (master/slave) of all local ports. The synchronization algorithm computes the clock offset between the master and slave clock. There are two mechanisms, Delay Request-response Mechanism and Peer Delay Mechanism, for measuring the propagation time of an event message.

The PTP system has three types of PTP devices, boundary clock, end-to-end transparent clock and peer-to-peer transparent clock. Only boundary clock can participate in the selection of the best master clock.

## PTP Global Settings

This window is used to configure the PTP function globally.

To view this window, click **L2 Features > PTP > PTP Global Settings**, as shown below:

The screenshot shows the 'PTP Global Settings' window. It includes fields for PTP State (Disabled), PTP Mode (E2E Transparent), PTP Transport Protocol (UDP), Unit (1), PTP Clock Domain Number (0-127) (0), PTP Clock Domain Name (Max: 32 characters), and two Apply buttons.

**Figure 4-123 PTP Global Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>PTP State</b>	Use the drop-down menu to enable or disable the PTP state.
<b>PTP Mode</b>	Use the drop-down menu to select the PTP device type of the Switch. The Switch supports three PTP device types, Boundary, P2P Transparent, and E2E Transparent. The default is E2E Transparent.
<b>PTP Transport Protocol</b>	Use the drop-down menu to select the transport protocol that will be used for the communication path. The default option is UDP.
<b>Unit</b>	Select the unit you wish to configure.
<b>PTP Clock Domain Number (0-127)</b>	Enter the domain attribute of the local clock. All PTP messages, data sets, state machines, and all other PTP entities are always associated with a particular domain number. The range is from 0 to 127. The default value is 0. In a stacking system, each unit runs PTP independently, each unit could run in the same domain or different domains.
<b>PTP Clock Domain Name</b>	Enter the domain name for a specified domain number.

Click the **Apply** button to accept the changes made for each individual section.

## PTP Port Settings

This window is used to configure the per port state of the PTP clock.

To view this window, click **L2 Features > PTP > PTP Port Settings**, as shown below:

The screenshot shows the 'PTP Port Settings' window. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), 'To Port' (set to 01), and a 'State' dropdown (set to 'Disabled'). To the right of these is an 'Apply' button. Below this is a table with 24 rows, each representing a port from 1 to 24. The 'Port' column lists the port numbers, and the 'State' column shows that all ports are currently set to 'Disabled'.

Port	State
1	Disabled
2	Disabled
3	Disabled
4	Disabled
5	Disabled
6	Disabled
7	Disabled
8	Disabled
9	Disabled
10	Disabled
11	Disabled

13	Disabled
14	Disabled
15	Disabled
16	Disabled
17	Disabled
18	Disabled
19	Disabled
20	Disabled
21	Disabled
22	Disabled
23	Disabled
24	Disabled

Figure 4-124 PTP Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the port range to use for this configuration.
<b>State</b>	Use the drop-down menu to enable or disable the PTP clock state on the specified ports.

Click the **Apply** button to accept the changes made.

## PTP Boundary Clock Settings

This window is used to configure the PTP boundary clock attributes and requires at least one parameter to execute. To view this window, click **L2 Features > PTP > PTP Boundary Clock Settings**, as shown below:

The screenshot shows a web-based configuration interface for a PTP Boundary Clock. At the top, there's a header bar with the title "PTP Boundary Clock Settings". Below the header, there are two input fields: "Priority 1 (0-255)" and "Priority 2 (0-255)", both containing the value "0". To the right of these fields is a blue "Apply" button. In the top right corner of the main area, there's a small circular icon with the text "Safeguard".

**Figure 4-125 PTP Boundary Clock Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Priority 1 (0-255)</b>	This is used in the execution of the best master clock algorithm. Lower values take precedence. The range is from 0 to 255. Zero indicates the highest precedence.
<b>Priority 2 (0-255)</b>	This is used in the execution of the best master clock algorithm. Lower values take precedence. In the event that the operation of the BMC algorithm fails to order the clocks based on the values of Priority1, the clock's class and the clock's accuracy; the Priority 2 will allow the creation of lower values compared to the other devices. The range is from 0 to 255. Zero indicates the highest precedence.

Click the **Apply** button to accept the changes made.

## PTP Boundary Port Settings

This window is used to configure the attributes of the PTP boundary clock. The configuration takes effect when the PTP device is a boundary type.

To view this window, click **L2 Features > PTP > PTP Boundary Port Settings**, as shown below:

**PTP Boundary Port Settings**

Unit	1	To Port	01

Figure 4-126 PTP Boundary Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the port range to use for this configuration.
<b>Announce Interval (1-16)</b>	Click the radio button and enter the mean time interval between successive announce messages. Referred to as the announce interval. In line with the IEEE1588 protocol, the value of the announce interval is represented as the logarithm to the base 2 of this time measured in seconds. The entered value should be 1, 2, 4, 8, or 16. If entered an invalid number, it will be automatically adjusted to allow the bigger and closest value. The default value is 2 seconds.
<b>Announce Receipt Timeout (2-10)</b>	Click the radio button and enter the announce interval number that has to pass without receiving an Announce message before the occurrence of the ANNOUNCE RECEIPT TIMEOUT EXPIRES event. This value multiplied by the announce interval value is equal to the interval time of the announce receipt timeout. The range is from 2 to 10.
<b>Delay Mechanism</b>	Use the drop-down menu to specify the mechanism for measuring the propagation delay time of an event message. E2E - The port is configured to use the delay request-response mechanism. P2P - The peer delay mechanism.

	The default is E2E.
<b>Delay Request Interval (0-5)</b>	Enter the permitted mean time interval between successive delay request messages which are sent by a slave to a specific port on the master. This mean time interval value is determined and advertised by a master.
<b>Pdelay Request Interval (1-32)</b>	Enter the permitted mean time interval between successive pdelay_request messages.
<b>Synchronization Interval (1-2)</b>	Enter the mean time interval between successive Sync messages. Referred to as syncInterval. Tick the <b>Half Second</b> check box to have the 0.5 second of syncInterval.

Click the **Apply** button to accept the changes made.

## PTP Peer to Peer Transparent Port Settings

This window is used to configure the Pdelay Request Interval of the P2P transparent clock.

To view this window, click **L2 Features > PTP > PTP Peer to Peer Transparent Port Settings**, as shown below:

Port	Pdelay Request Interval
1	1
2	1
3	1
4	1
5	1
6	1
7	1
8	1
9	1
10	1
11	1
12	1

Figure 4-127 PTP Peer to Peer Transparent Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the port range to use for this configuration.
<b>Pdelay Request Interval (1-32)</b>	Enter the permitted mean time interval between successive Pdelay request messages.

Click the **Apply** button to accept the changes made.

## PTP Clock Information

This window is used to display the active attributes of the PTP clock. When PTP State is disabled in PTP Global Settings window, PTP Clock Identity displays 0000000000000000.

To view this window, click **L2 Features > PTP > PTP Clock Information**, as shown below:

The screenshot shows the 'PTP Clock Information' window. At the top left is a dropdown menu labeled 'Unit' with '1' selected. On the right is a 'Safeguard' button. The main area is divided into sections: 'PTP End-to-End Transparent Clock Information' and 'PTP Clock Parent Information'. Under the first section, there are seven entries: PTP State (Disabled), PTP Clock Mode (End-to-End Transparent Clock), PTP Transport Protocol (UDP), PTP Clock Domain Number (0), PTP Clock Domain Name (empty), PTP Clock Delay Mechanism (E2E), and PTP Clock Identity (000102ffe030400). Under the second section, it says 'The transparent clock does not have this attribute.'

**Figure 4-128 PTP Clock Information window**

The fields that can be configured are described below:

Parameter	Description
Unit	Select the unit you wish to configure.

## PTP Port Information

This window is used to display the active attributes of the special PTP ports on the switch.

To view this window, click **L2 Features > PTP > PTP Port Information**, as shown below:

## IPv4 Static/Default Route Settings

The Switch supports static routing for IPv4 formatted addressing. Users can create up to 256 static route entries for IPv4. For IPv4 static routes, once a static route has been set, the Switch will send an ARP request packet to the next hop router that has been set by the user. Once an ARP response has been retrieved by the Switch from that next hop, the route becomes enabled. However, if the ARP entry already exists, an ARP request will not be sent.

The Switch also supports a floating static route, which means that the user may create an alternative static route to a different next hop. This secondary next hop device route is considered as a backup static route for when the primary static route is down. If the primary route is lost, the backup route will uplink and its status will become Active.

Entries into the Switch's forwarding table can be made using both an IP address subnet mask and a gateway.

To view the following window, click **L3 Features > IPv4 Static/Default Route Settings**, as show below:

**IPv4 Static/Default Route Settings**

Total Entries: 0						
IP Address/Netmask	Gateway	IP Tunnel Name	Cost	Protocol	Backup	Status

Figure 5-1 IPv4 Static/Default Route Settings window

The fields that can be configured are described below:

Parameter	Description
<b>IP Address</b>	This field allows the entry of an IPv4 address to be assigned to the static route. Tick the <b>Default</b> check box to be assigned to the default route.
<b>Netmask</b>	This field allows the entry of a subnet mask to be applied to the corresponding subnet mask of the IP address.
<b>IP Tunnel Name</b>	Tick the <b>IP Tunnel</b> check box and enter the IP tunnel name used.
<b>Gateway</b>	This field allows the entry of a Gateway IP Address to be applied to the corresponding gateway of the IP address.
<b>Metric (1-65535)</b>	Represents the metric value of the IP interface entered into the table. This field may read a number between 1 and 65535.
<b>Backup State</b>	Each IP address can only have one primary route, while other routes should be assigned to the backup state. When the primary route failed, Switch will try the backup routes according to the order learnt by the routing table until route success. The field represents the Backup state that the Static and Default Route is configured for.
<b>Null Interface</b>	Use the drop-down menu to enable or disable the null interface as the next hop.

Click the **Apply** button to accept the changes made.

## IPv4 Route Table

The IP routing table stores all the external routes information of the Switch. This window displays all the external route information on the Switch.

To view the following window, click **L3 Features > IPv4 Route Table**, as show below:

IPv4 Route Table						Safeguard		
<input checked="" type="radio"/> Network Address	<input type="text"/>	(e.g.: 172.18.208.11/24)						
<input type="radio"/> IP Address	<input type="text"/>	(e.g.: 172.18.208.11)						
<input type="checkbox"/> RIP <input type="checkbox"/> Hardware						Find		
Total Entries: 1								
IP Address	Netmask	Gateway	Interface Name	Cost	Protocol			
192.168.69.0	255.255.255.0	0.0.0.0	System	1	Local			
1/1		1	<input type="text"/>	Go				

Figure 5-2 IPv4 Route Table window

The fields that can be configured are described below:

Parameter	Description
<b>Network Address</b>	Enter the destination network address of the route want to be displayed.
<b>IP Address</b>	Enter the destination IP address of the route want to be displayed. The longest prefix matched route will be displayed.
<b>RIP</b>	Tick the check box to display only RIP routes.
<b>Hardware</b>	Tick the check box to display only the routes that have been written into the chip.

Click the **Find** button to locate a specific entry based on the information entered.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## IPv6 Static/Default Route Settings

A static entry of an IPv6 address can be entered into the Switch's routing table for IPv6 formatted addresses.

To view the following window, click **L3 Features > IPv6 Static/Default Route Settings**, as show below:

IPv6 Static/Default Route Settings							Safeguard
IPv6 Address/Prefix Length	<input type="text"/>	<input checked="" type="checkbox"/> Default					
IP Tunnel Name	<input type="text"/>	<input type="checkbox"/> IP Tunnel					
Interface Name	<input type="text"/>	(Max: 12 characters)					
Nexthop Address	<input type="text"/>	(e.g.: 3FFE::1)					
Metric (1-65535)	<input type="text"/>						
Backup State	Primary	▼					<b>Apply</b>
							<b>Delete All</b>
Total Entries: 0							
IPv6 Prefix	Protocol	Metric	Next Hop	Interface Name	Backup	Status	

Figure 5-3 IPv6 Static/Default Route Settings window

The fields that can be configured are described below:

Parameter	Description
<b>IPv6 Address/Prefix</b>	Enter the destination network for the route, or tick the Default check box to be

<b>Length</b>	assigned to the default route.
<b>IP Tunnel Name</b>	Tick the <b>IP Tunnel</b> check box and enter the IP tunnel name used.
<b>Interface Name</b>	The IP Interface where the static IPv6 route is created.
<b>Nexthop Address</b>	The corresponding IPv6 address for the next hop gateway address in IPv6 format.
<b>Metric (1-65535)</b>	The metric of the IPv6 interface entered into the table representing the number of routers between the Switch and the IPv6 address above. Metric values allowed are between 1 and 65535.
<b>Backup State</b>	Each IPv6 address can only have one primary route, while other routes should be assigned to the backup state. When the primary route failed, the Switch will try the backup routes according to the order learnt by the routing table until route success. This field represents the backup state for the IPv6 configured. This field may be <b>Primary</b> or <b>Backup</b> .

Click the **Apply** button to accept the changes made.

Click the **Delete All** button to remove all the entries listed.

## IPv6 Route Table

This window is used to display the current IPv6 routing table.

To view the following window, click **L3 Features > IPv6 Route Table**, as show below:

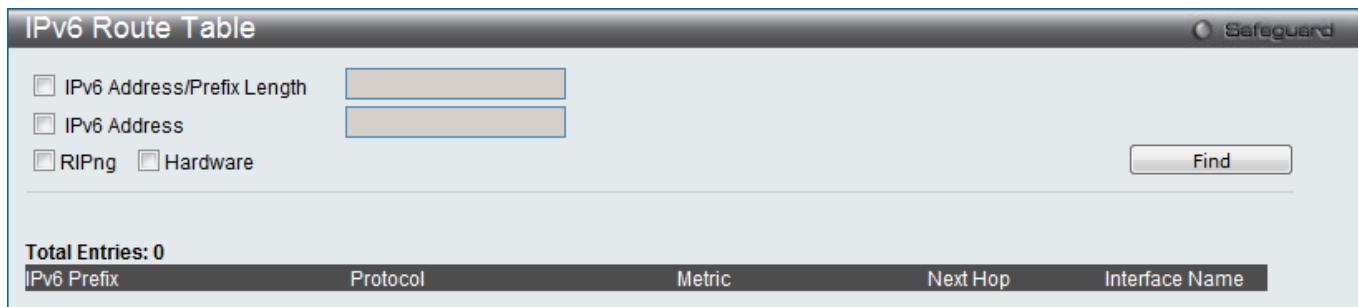

Figure 5-4 IPv6 Route Table window

The fields that can be configured are described below:

Parameter	Description
<b>IPv6 Address/Prefix Length</b>	Tick the check box and enter the IPv6 destination network address of the route.
<b>IPv6 Address</b>	Tick the check box and enter the IPv6 address.
<b>RIPng</b>	Tick the check box to display the RIPng route entries.
<b>Hardware</b>	Tick the check box to display the route entries which have been written into hardware table.

Click the **Find** button to locate a specific entry based on the information entered.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## Policy Route Settings

Policy Based routing is a method used by the Switch to give specified devices a cleaner path to the Internet. Used in conjunction with the Access Profile feature, the Switch will identify traffic originating from a device using the Access Profile feature and forward it on to a next hop router that has a more direct connection to the Internet than the normal routing scheme of your network.

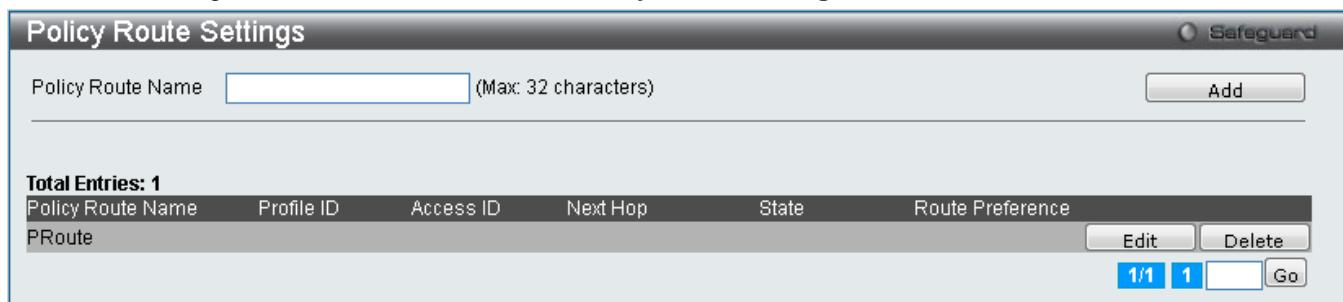

Take the example adjacent picture. Let's say that the PC with IP address 10.1.1.1 belongs to the manager of a company while the other PCs belong to employees. The network administrator hopes to circumvent network traffic by configuring the Policy Routing Switch to make a more direct connection to the Internet using a next hop router (10.2.2.2) that is directly attached to a Gateway router (10.3.3.3), thus totally avoiding the normal network and its related traffic. To accomplish this, the user must configure the Access Profile feature of the Switch to have the PC, with IP address 10.1.1.1 as the Source IP address and the Internet address as the destination IP address (learned through routing protocols), along with other pertinent information. Next, the administrator must configure the Policy Route window to be enabled for this Access Profile and its associated rule, and the Next Hop Router's IP address (10.2.2.2) must be set. Finally, this Policy Route entry must be enabled.

Once completed, the Switch will identify the IP address using the Access Profile function, recognize that it has a Policy Based route, and then forward the information on to the specified next hop router, that will, in turn, relay packets to the gateway router. Thus, the new, cleaner path to the Internet has been formed.

There are some restrictions and cautions when implementing this feature:

1. The access profile must first be created, along with the accompanying rule. If the administrator attempts to enable this feature without the access profile, an error message will be produced.
2. If the access profile is configured as Deny, the packet will be dropped and not forwarded to the next hop destination.
3. If the administrator deletes a rule or profile that is directly linked to a configured policy route, and error message will be prompted to the administrator.

To view the following window, click **L3 Features > Policy Route Settings**, as shown below:

**Figure 5-5 Policy Base Routing Example window**

Policy Route Settings						Safeguard
Policy Route Name		(Max: 32 characters)				Add
<b>Total Entries: 1</b>						
Policy Route Name	Profile ID	Access ID	Next Hop	State	Route Preference	
PRoute						<input type="button" value="Edit"/> <input type="button" value="Delete"/>
1/1	1	<input type="text"/>	<input type="button" value="Go"/>			

**Figure 5-6 Policy Route Settings window**

Click the **Add** button to add a new entry based on the information entered.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

After clicking the **Edit** button, the following page will appear:

The screenshot shows a configuration window titled "Policy Route Settings". It contains the following fields:

- Policy Route Name:** PRoute
- Profile ID (1-6):** [Empty input field]
- Access ID (1-256):** [Empty input field]
- Next Hop IPv4 Address:** [Empty input field] (e.g.: 172.18.211.10)
- State:** Disabled
- Route Preference:** Default

At the bottom right are two buttons: "<< Back" and "Apply".

Figure 5-7 Policy Route Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Policy Route Name</b>	Enter a name of no more than 32 alphanumeric characters that will be used to identify this policy route.
<b>Profile ID (1-6)</b>	Enter the Profile ID number of the Access Profile, previously created, which will be used to identify packets as following this Policy Route. This access profile, along with the access rule, must first be constructed before this policy route can be created.
<b>Access ID (1-256)</b>	Enter the Access ID number of the Access Rule, previously created, which will be used to identify packets as following this Policy Route. This access rule, along with the access profile, must first be constructed before this policy route can be created.
<b>Next Hop IPv4 Address</b>	This is the IP address of the Next Hop router that will have a direct connection to the gateway router connected to the Internet.
<b>State</b>	Use the pull-down menu to enable or disable this Policy Route.
<b>Route Preference</b>	Select the route preference used here. Options to choose from are <b>Default</b> and <b>BPR</b> .

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

## IP Forwarding Table

The IP forwarding table stores all the direct connected IP information. On this page the user can view all the direct connected IP information.

To view the following window, click **L3 Features > IP Forwarding Table**, as show below:

IP Forwarding Table			
<input checked="" type="radio"/> IP Address	<input type="text"/>		
<input type="radio"/> Interface Name	<input type="text"/>		
<input type="radio"/> Port	1	01	
			<input type="button" value="Find"/>
<b>Total Entries: 2</b>			
Interface Name	IP Address	Port	Learned
System	10.90.90.5	1:21	Dynamic
System	10.90.90.6	1:21	Dynamic
			<input type="button" value="1/1"/> <input type="button" value="1"/> <input type="text"/> <input type="button" value="Go"/>

Figure 5-8 IP Forwarding Table

Click the **IP Address**, **Interface Name** or **Port** radio button, enter the information and click the **Find** button to locate a specific entry based on the information entered.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## Route Preference Settings

This window is used to configure the route type preference. The route with smaller preference has higher priority. The preference for local routes is fixed to 0.

To view the following window, click **L3 Features > Route Preference Settings**, as shown below:

Route Preference Settings	
Static (1-999)	<input type="text" value="60"/>
Default (1-999)	<input type="text" value="1"/>
RIP (1-999)	<input type="text" value="100"/>
Local	0
	<input type="button" value="Apply"/>

Figure 5-9 Route Preference Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Static</b>	Enter the Static route type preference value here.
<b>Default</b>	Enter the Default route type preference value here.
<b>RIP</b>	Enter the RIP route type preference value here.

Click the **Apply** button to accept the changes made.

## Route Redistribution

### Route Redistribution Settings

This page is used to configure redistribute routing information from one routing protocols to another.

To view the following window, click **L3 Features > Route Redistribution > Route Redistribution Settings**, as shown below:

The window title is "Route Redistribution Settings". It has three dropdown menus: "Destination Protocol" set to "RIP", "Source Protocol" set to "RIP", and "Metric (0-16)" set to "1". Below these are two entries in a table:

Source Protocol	Destination Protocol	Type	Metric	Edit	Delete
Static	RIP	All	1	<input type="button" value="Edit"/>	<input type="button" value="Delete"/>
Local	RIP	All	2	<input type="button" value="Edit"/>	<input type="button" value="Delete"/>

Figure 5-10 Route Redistribution Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Destination Protocol</b>	Specifies the destination protocol.
<b>Source Protocol</b>	Specifies the source protocol. Options to choose from are <b>RIP</b> , <b>Static</b> and <b>Local</b> .
<b>Metric (0-16)</b>	Specifies the metric value for the redistributed routes.

Click the **Apply** button to accept the changes made.

Click the **Edit** button to re-configure the specified entry.

Click the **Delete** button to remove the specified entry.

## IPv6 Route Redistribution Settings

Here the user can configure the IPv6 route redistribution settings.

To view the following window, click **L3 Features > Route Redistribution > IPv6 Route Redistribution Settings**, as shown below:

The window title is "IPv6 Route Redistribution Settings". It has three dropdown menus: "Destination Protocol" set to "RIPng", "Source Protocol" set to "Local", and "Type" set to "Type-1". Below these are two entries in a table:

Source Protocol	Destination Protocol	Type	Metric	Edit	Delete
Local	RIPng	All	1	<input type="button" value="Edit"/>	<input type="button" value="Delete"/>
Static	RIPng	All	2	<input type="button" value="Edit"/>	<input type="button" value="Delete"/>

Figure 5-11 IPv6 Route Redistribution Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Destination Protocol</b>	Select the destination protocol used here.
<b>Source Protocol</b>	Select the source protocol used here. Options to choose from are <b>Local</b> , and <b>Static</b> .
<b>Metric</b>	Enter the metric value for this entry here.

Click the **Apply** button to accept the changes made.

Click the **Edit** button to re-configure the specified entry.

Click the **Delete** button to remove the specified entry.

## IP Tunnel

The Switch supports IP tunneling. The idea behind this feature is to be able to integrate IPv6 into and coexist with existing IPv4 networks. It is expected that IPv4 and IPv6 hosts will need to coexist for a substantial time during the steady migration from IPv4 to IPv6, and the development of transition strategies, tools, and mechanisms has been part of the basic IPv6 design from the start. This IPv6 tunneling mechanism is one of D-Link's strategies for solving the transition from IPv4 to IPv6.

## IP Tunnel Settings

This window is used to configure IP Tunnel Settings.

To view the following window, click **L3 Features > IP Tunnel > IP Tunnel Settings**, as shown below:

IP Tunnel Settings					Safeguard	
Interface Name	<input type="text"/> (Max: 12 characters)				<input type="button" value="Add"/>	<input type="button" value="Find"/>
<input type="button" value="View All"/>						
<b>Total Entries: 1</b>						
Interface Name	Admin.State	Tunnel Mode	Tunnel Source	Tunnel Destination		
IPTunnel	Enabled	Manual	10.90.90.90	10.90.90.254		
				<input type="button" value="Edit"/>	<input type="button" value="Delete"/>	

Figure 5-12 IP Tunnel Settings window

The fields that can be configured are described below:

Parameter	Description
Interface Name	Enter the IP tunnel interface name.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

Click the **Edit** button to see the following window.

IP Tunnel Settings		Safeguard
Interface Name	<input type="text" value="IPTunnel"/>	
Interface Admin State	<input type="button" value="Enabled"/> ↓	
Tunnel Mode	<input type="button" value="Manual"/> ↓	
IPv6 Address/Prefix Length	<input type="text" value="2233::1/64"/> (e.g.: 2233::1/64)	
Source IP Address	<input type="text" value="10.90.90.90"/> (e.g.: 10.90.90.90)	
Destination IP Address	<input type="text" value="10.90.90.254"/> (e.g.: 10.90.90.90)	
<input type="button" value="&lt;&lt;Back"/> <input type="button" value="Apply"/>		
<b>Total Entries: 1</b>		
Address Type	IPv6 Address	
Global Unicast Address	2233::1/64	

**Figure 5-13 IP tunnel Settings - Edit window**

The fields that can be configured are described below:

Parameter	Description
<b>Interface Admin State</b>	Use the drop-down menu to enable or disable the interface admin state.
<b>Tunnel Mode</b>	Use the drop-down menu to select the tunnel modes. Available selections are <i>None</i> , <i>Manual</i> , <i>6to4</i> , and <i>ISATAP</i> .
<b>IPv6 Address/Prefix Length</b>	Enter the IPv6 network address.
<b>Source IP Address</b>	Enter the source IP address.
<b>Destination IP Address</b>	Enter the destination IP address.

Click the <<Back button to return to the previous window.

Click the **Apply** button to accept the changes made for each individual section.

## IP Tunnel GRE Settings

This window is used to configure an existing tunnel as a GRE tunnel (IPv6/IPv4-in-IPv4 or IPv6/IPv4-in-IPv6) on the Switch. If this tunnel has been configured in another mode before, the tunnel's information will still exist in the database. However, whether the tunnel's former information is valid or not, it depends on the current mode.

GRE tunnels are simple point-to-point tunnels that can be used within a site or between sites.

When a user wants to configure a GRE IPv6/IPv4-in-IPv4 tunnel, both the source and destination address must be IPv4 addresses because the delivery protocol is the IPv4 protocol. If the source and destination address type are not consistent, then the GRE tunnel will not work.

When a user wants to configure a GRE IPv6/IPv4-in-IPv6 tunnel, both the source and destination address must be IPv6 addresses because the delivery protocol is the IPv6 protocol. If the source and destination address type are not consistent then the GRE tunnel will not work.

To view the following window, click **L3 Features > IP Tunnel > IP Tunnel GRE Settings**, as shown below:

The screenshot shows the 'IP Tunnel GRE Settings' window. At the top, there is a search bar labeled 'Interface Name' with a maximum length of 12 characters, a 'Find' button, and a 'View All' button. Below the search bar, the text 'Total Entries: 1' is displayed. A table follows, showing one entry for an IPTunnel:

Interface Name	Admin.State	Tunnel Mode	IPv4 Address	Tunnel Source	Tunnel Destination	Edit
IPTunnel	Enabled	Manual	-	10.90.90.90	10.90.90.254	<b>Edit</b>

**Figure 5-14 IP Tunnel GRE Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Enter the IP tunnel interface name.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Edit** button to re-configure the specific entry.

Click the **Edit** button to see the following window.

IP Tunnel GRE Settings

Safeguard

Interface Name	IPTunnel
Network Address	2233::1/64 (e.g.: 10.90.90.90/8)
IPv6 Address/Prefix Length	2233::1/64 (e.g.: 2233::1/64)
<input checked="" type="radio"/> Source IPv4 Address	10.90.90.90 (e.g.: 10.90.90.90)
<input type="radio"/> Source IPv6 Address	(e.g.: 2233::1)
<input checked="" type="radio"/> Destination IPv4 Address	10.90.90.254 (e.g.: 10.90.90.90)
<input type="radio"/> Destination IPv6 Address	(e.g.: 2233::1)

<<Back      Apply

Total Entries: 1

Address Type	IPv6 Address
Global Unicast Address	2233::1/64

Figure 5-15 IP tunnel GRE Settings – Edit window

The fields that can be configured are described below:

Parameter	Description
<b>Network Address</b>	Enter the IPv4 network address assigned to the GRE tunnel interface. IPv4 processing will be enabled on the IPv4 tunnel interface when an IPv4 address is configured. This IPv4 address is not connected with the tunnel source or destination IPv4 address.
<b>IPv6 Address/Prefix Length</b>	Enter the IPv6 network address assigned to the GRE tunnel interface. IPv6 processing will be enabled on the IPv6 tunnel interface when an IPv6 address is configured. This IPv6 address is not connected with the tunnel source or destination IPv4 address.
<b>Source IPv4 Address</b>	Click the radio button and enter the source IPv4 address of the GRE tunnel interface. It is used as the source address for packets in the tunnel. The address type that will be used depends on the Delivery Protocol. The address type used at both the source and destination must be consistent, otherwise, the GRE tunnel will not work.
<b>Source IPv6 Address</b>	Click the radio button and enter the source IPv6 address of the GRE tunnel interface. It is used as the source address for packets in the tunnel. The address type that will be used depends on the Delivery Protocol. The address type used at both the source and destination must be consistent, otherwise, the GRE tunnel will not work.
<b>Destination IPv4 Address</b>	Click the radio button and enter the destination IPv4 address of the GRE tunnel interface. It is used as the destination address for packets in the tunnel. The address type that will be used depends on the Delivery Protocol. The address type used at both the source and destination must be consistent, otherwise, the GRE tunnel will not work.
<b>Destination IPv6 Address</b>	Click the radio button and enter the destination IPv6 address of the GRE tunnel interface. It is used as the destination address for packets in the tunnel. The address type that will be used depends on the Delivery Protocol. The address type used at both the source and destination must be consistent, otherwise, the GRE tunnel will not work.

Click the <<Back button to return to the previous window.

Click the **Apply** button to accept the changes made for each individual section.

# RIP

The Routing Information Protocol is a distance-vector routing protocol. There are two types of network devices running RIP - active and passive. Active devices advertise their routes to others through RIP messages, while passive devices listen to these messages. Both active and passive routers update their routing tables based upon RIP messages that active routers exchange. Only routers can run RIP in the active mode.

Every 30 seconds, a router running RIP broadcasts a routing update containing a set of pairs of network addresses and a distance (represented by the number of hops or routers between the advertising router and the remote network). So, the vector is the network address and the distance is measured by the number of routers between the local router and the remote network.

RIP measures distance by an integer count of the number of hops from one network to another. A router is one hop from a directly connected network, two hops from a network that can be reached through a router, etc. The more routers between a source and a destination, the greater the RIP distance (or hop count).

There are a few rules to the routing table update process that help to improve performance and stability. A router will not replace a route with a newly learned one if the new route has the same hop count (sometimes referred to as 'cost'). So learned routes are retained until a new route with a lower hop count is learned.

When learned routes are entered into the routing table, a timer is started. This timer is restarted every time this route is advertised. If the route is not advertised for a period of time (usually 180 seconds), the route is removed from the routing table.

RIP does not have an explicit method to detect routing loops. Many RIP implementations include an authorization mechanism (a password) to prevent a router from learning erroneous routes from unauthorized routers.

To maximize stability, the hop count RIP uses to measure distance must have a low maximum value. Infinity (that is, the network is unreachable) is defined as 16 hops. In other words, if a network is more than 16 routers from the source, the local router will consider the network unreachable.

RIP can also be slow to converge (to remove inconsistent, unreachable or looped routes from the routing table) because RIP messages propagate relatively slowly through a network.

Slow convergence can be solved by using split horizon update, where a router does not propagate information about a route back to the interface on which it was received. This reduces the probability of forming transient routing loops.

Hold down can be used to force a router to ignore new route updates for a period of time (usually 5 seconds) after a new route update has been received. This allows all routers on the network to receive the message.

A router can 'poison reverse' a route by adding an infinite (16) hop count to a route's advertisement. This is usually used in conjunction with triggered updates, which force a router to send an immediate broadcast when an update of an unreachable network is received.

## **RIP Version 1 Message Format**

There are two types of RIP messages: routing information messages and information requests. Both types use the same format.

The Command field specifies an operation according the following table:

Command	Description
---------	-------------

<b>1</b>	Request for partial or full routing information.
<b>2</b>	Response containing network-distance pairs from sender's routing table.
<b>3</b>	Turn on trace mode.
<b>4</b>	Turn off trace mode.
<b>5</b>	Reserved for Sun Microsystems internal use.
<b>9</b>	Update Request.
<b>10</b>	Update Response.
<b>11</b>	Update Acknowledgement

### **RIP Command Codes**

The field VERSION contains the protocol version number (1 in this case), and is used by the receiver to verify which version of RIP the packet was sent.

### **RIP 1 Message**

RIP is not limited to TCP/IP. Its address format can support up to 14 octets (when using IP, the remaining 10 octets must be zeros). Other network protocol suites can be specified in the Family of Source Network field (IP has a value of 2). This will determine how the address field is interpreted.

RIP specifies that the IP address, 0.0.0.0, denotes a default route.

The distances, measured in router hops are entered in the Distance to Source Network, and Distance to Destination Network fields.

### **RIP 1 Route Interpretation**

RIP was designed to be used with classed address schemes, and does not include an explicit subnet mask. An extension to version 1 does allow routers to exchange subnet addresses, but only if the subnet mask used by the network is the same as the subnet mask used by the address. This means the RIP version 1 cannot be used to propagate classless addresses.

Routers running RIP version 1 must send different update messages for each IP interface to which it is connected. Interfaces that use the same subnet mask as the router's network can contain subnet routes, other interfaces cannot. The router will then advertise only a single route to the network.

### **RIP Version 2 Extensions**

RIP version 2 includes an explicit subnet mask entry, so RIP version 2 can be used to propagate variable length subnet addresses or CIDR classless addresses. RIP version 2 also adds an explicit next hop entry, which speeds convergence and helps prevent the formation of routing loops.

### **RIP2 Message Format**

The message format used with RIP2 is an extension of the RIP1 format. RIP version 2 also adds a 16-bit route tag that is retained and sent with router updates. It can be used to identify the origin of the route. Because the version number in RIP2 occupies the same octet as in RIP1, both versions of the protocols can be used on a given router simultaneously without interference.

## **RIP Settings**

This window is used to configure the RIP settings for one or more IP interfaces.

To view the following window, click **L3 Features > RIP > RIP Settings**, as shown below:

The screenshot shows the 'RIP Settings' window. At the top, there's a 'RIP Global Settings' section with fields for 'Update Time (5-65535)' (set to 30), 'Timeout Time (5-65535)' (set to 180), and 'Garbage Collection Time (5-65535)' (set to 120). Below this are buttons for 'Apply' and 'Find'. A table titled 'Total Entries: 1' shows one entry: 'System' with IP '192.168.69.123/24', TX Mode 'Disabled', RX Mode 'Disabled', Authentication 'Disabled', and State 'Disabled'. There's also an 'Edit' button for this entry. The window has a 'Safeguard' icon in the top right corner.

Total Entries: 1					
Interface Name	IP Address	TX Mode	RX Mode	Authentication	State
System	192.168.69.123/24	Disabled	Disabled	Disabled	Disabled

**Figure 5-16 RIP Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>RIP State</b>	Specifies that the RIP state will be enabled or disabled. If the state is disabled, then RIP packets will not be either transmitted or received by the interface. The network configured on this interface will not be in the RIP database.
<b>Update Time (5-65535)</b>	Enter the value of the rate at which RIP updates are sent.
<b>Timeout Time (5-65535)</b>	Enter the value of the time after which a RIP route is declared to be invalid.
<b>Garbage Collection Time (5-65535)</b>	Enter the value of the time for which a RIP route will be kept before it is removed from routing table.
<b>Interface Name</b>	Specifies the IP interface name used for this configuration.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Find** button to find the specified entry.

Click the **View All** button to view all the entries.

Click the **Edit** button to re-configure the selected entry.

After clicking the **Edit** button, the following window will appear.

The screenshot shows the 'RIP Settings' window. At the top, there are dropdown menus for 'Interface Name' (set to 'System'), 'TX Mode' (set to 'Disabled'), 'RX Mode' (set to 'Disabled'), 'State' (set to 'Disabled'), and 'Authentication' (set to 'Disabled'). A password field is present with the placeholder '(Max:16 characters)'. An 'Apply' button is located to the right. Below this, a section titled 'RIP Interface Detail Information' displays the following table:

Interface Name	System	IP Address	192.168.69.123/24 (Link Up)
Interface Metric	1	Administrative State	Disabled
TX Mode	Disabled	RX Mode	Disabled
Authentication	Disabled		

An '<<Back' button is located at the bottom right of this section.

Figure 5-17 RIP Settings – Edit window

The fields that can be configured are described below:

Parameter	Description
<b>TX Mode</b>	Specifies the RIP transmission mode. Options to choose from are <b>v1 Only</b> , <b>v1 Compatible</b> and <b>v2 Only</b> . Select <b>Disable</b> to disable this option.
<b>RX Mode</b>	Specifies the RIP receive mode Options to choose from are <b>v1 Only</b> , <b>v2 Only</b> and <b>v1 or v2</b> . Select <b>Disable</b> to disable this option.
<b>State</b>	Specifies that the RIP state will be enabled or disabled. If the state is disabled, then RIP packets will not be either transmitted or received by the interface. The network configured on this interface will not be in the RIP database.
<b>Authentication</b>	Specifies to set the state of authentication. When the authentication state is enabled, enter the password used in the space provided.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to return to the previous window.

## RIPng

The Switch supports Routing Information Protocol next generation (RIPng). RIPng is a routing protocol that exchanges routing information used to compute routes and is intended for IPv6-based networks.

### RIPng Global Settings

This window allows users to set up RIPng.

To view the following window, click **L3 Features > RIP>RIPng > RIPng Global Settings**, as shown below:

The RIPng Global Settings window allows you to configure global RIPng parameters. It includes fields for enabling/disabling RIPng, selecting the method (Split Horizon), and setting update, expire, and garbage collection times.

RIPng Global Settings	
RIPng State	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
Method	Split Horizon
Update Time (5-65535)	30 sec
Expire Time (1-65535)	180 sec
Garbage Collection Time (1-65535)	120 sec
<input type="button" value="Apply"/>	

Figure 5-18 RIPng Global Settings window

The fields that can be configured are described below:

Parameter	Description
<b>RIPng State</b>	Click the radio buttons to enable or disable RIPng globally. The default setting is Disabled.
<b>Method</b>	Use the drop-down menu to choose from <b>No Horizon</b> , <b>Split Horizon</b> , and <b>Poison Reverse</b> . <b>No Horizon</b> – Configured to not use any horizon. <b>Split Horizon</b> – Configured to use basic split horizon. This is the default setting. <b>Poison Reverse</b> – Configured to use split horizon with poison reverse.
<b>Update Time (5-65535)</b>	Enter the value, in seconds, of the update timer.
<b>Expire Time (1-65535)</b>	Enter the interval, in seconds, of the expire timer.
<b>Garbage Collection Time (1-65535)</b>	Enter the value, in seconds, of the garbage collection timer.

Click the **Apply** button to accept the changes made.

## RIPng Interface Settings

This window allows users to configure RIPng interface settings.

To view the following window, click **L3 Features > RIP>RIPng > RIPng Interface Settings**, as shown below:

The RIPng Interface Settings window allows you to manage RIPng interfaces. It includes a search function for interface names and a table for listing and configuring individual interfaces.

RIPng Interface Settings		
Interface Name	<input type="text"/> (Max: 12 characters)	<input type="button" value="Find"/>
<input type="button" value="View All"/>		
<b>Total Entries: 0</b>		
Interface Name	State	Metric

Figure 5-19 RIPng Interface Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Enter the interface name for the RIPng configuration.

<b>State</b>	Modifies the state of the RIPng entry.
<b>Metric</b>	Modifies the metric value of the RIPng entry.

Click the **Find** button to find the interface entered.

Click the **View All** button to view all the interfaces configured on this switch.

Click the **Edit** button to re-configure the selected entry.

## VRRP

Virtual Routing Redundancy Protocol (VRRP) is a function on the Switch that dynamically assigns responsibility for a virtual router to one of the VRRP routers on a LAN. The VRRP router that controls the IP address associated with a virtual router is called the Master, and will forward packets sent to this IP address. This will allow any Virtual Router IP address on the LAN to be used as the default first hop router by end hosts. Utilizing VRRP, the administrator can achieve a higher available default path cost without needing to configure every end host for dynamic routing or routing discovery protocols.

Statically configured default routes on the LAN are prone to a single point of failure. VRRP is designed to eliminate these failures by setting an election protocol that will assign a responsibility for a virtual router to one of the VRRP routers on the LAN. When a virtual router fails, the election protocol will select a virtual router with the highest priority to be the Master router on the LAN. This retains the link and the connection is kept alive, regardless of the point of failure.

To configure VRRP for virtual routers on the Switch, an IP interface must be present on the system and it must be a part of a VLAN. VRRP IP interfaces may be assigned to every VLAN, and therefore IP interface, on the Switch. VRRP routers within the same VRRP group must be consistent in configuration settings for this protocol to function optimally.

## VRRP Global Settings

This window is used to configure the VRRP Global settings for this switch.

To view the following window, click **L3 Features > VRRP > VRRP Global Settings**, as shown below:

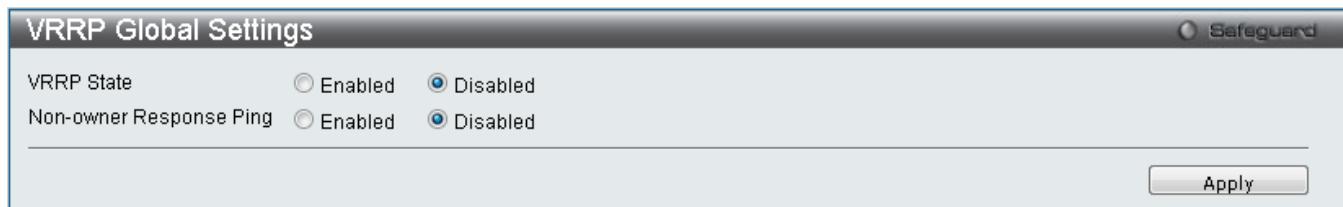

Figure 5-20 VRRP Global Settings window

The fields that can be configured are described below:

Parameter	Description
<b>VRRP State</b>	Specifies whether the VRRP Global state is enabled or disabled.
<b>Non-owner Response Ping</b>	Specifies that the virtual IP address is allowed to be pinged from other host end nodes to verify connectivity.

Click the **Apply** button to accept the changes made.

## VRRP Virtual Router Settings

This window is used to configure the VRRP virtual router settings.

To view the following window, click **L3 Features > VRRP > VRRP Virtual Router Settings**, as shown below:

Total Entries: 1				
VRID / Interface Name	Virtual IP Address	Master IP Address	Virtual Router State	State
1/System	10.90.90.90	10.90.90.90	Initialize	Disabled

**Figure 5-21 VRRP Virtual Router Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Specifies the IP interface name used to create a VRRP entry.
<b>State</b>	Specifies the state of the virtual router function of the interface.
<b>Preempt Mode</b>	This entry will determine the behavior of backup routers within the VRRP group by controlling whether a higher priority backup router will preempt a lower priority Master router. A True entry, along with having the backup router's priority set higher than the master's priority, will set the backup router as the Master router. A False entry will disable the backup router from becoming the Master router. This setting must be consistent with all routers participating within the same VRRP group.
<b>VRID (1-255)</b>	Specifies the ID of the Virtual Router used. All routers participating in this group must be assigned the same VRID value. This value must be different from other VRRP groups set on the Switch.
<b>Priority (1-254)</b>	Specifies the priority to be used for the Virtual Router Master election process. The VRRP Priority value may determine if a higher priority VRRP router overrides a lower priority VRRP router. A higher priority will increase the probability that this router will become the Master router of the group. A lower priority will increase the probability that this router will become the backup router. VRRP routers that are assigned the same priority value will elect the highest physical IP address as the Master router.
<b>Critical IP Address</b>	Specifies an IP address of the physical device that will provide the most direct route to the Internet or other critical network connections from this virtual router. This must be a real IP address of a real device on the network. If the connection from the virtual router to this IP address fails, the virtual router will automatically disable. A new Master will be elected from the backup routers participating in the VRRP group. Different critical IP addresses may be assigned to different routers participating in the VRRP group, and can therefore define multiple routes to the Internet or other critical network connections.
<b>IP Address</b>	Specifies the virtual router's IP address used. This IP address is also the default gateway that will be statically assigned to end hosts and must be set for all routers that participate in this group.
<b>Advertisement Interval (1-255)</b>	Specifies the time interval used between sending advertisement messages.
<b>Checking Critical IP</b>	Specifies the state of checking the status (active or inactive) of a critical IP address. Options to choose from are <b>Enabled</b> and <b>Disabled</b> .

Click the **Add** button to add a new entry.

Click the **Delete All** button to remove all the entries listed.

Click the **Edit** button to re-configure a specific entry listed.

Click the **Delete** button to remove a specific entry listed.

After clicking the **Edit** button, the following page will be displayed.

VRRP Virtual Router Detail Information			
Interface Name	System	Authentication Type	No Authentication
VRID	1	Virtual IP Address	10.90.90.90
Virtual MAC Address	00-00-5E-00-01-01	Virtual Router State	Initialize
State	Disabled	Priority	255
Master IP Address	10.90.90.90	Critical IP Address	10.2.2.2
Checking Critical IP	Disabled	Advertisement Interval	1 sec
Preempt Mode	True	Virtual Router Up Time	0 centi-sec

**Figure 5-22 VRRP Virtual Router Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>IP Address</b>	Specifies the virtual router's IP address used. This IP address is also the default gateway that will be statically assigned to end hosts and must be set for all routers that participate in this group.
<b>Priority</b>	Specifies the priority to be used for the Virtual Router Master election process
<b>Preempt Mode</b>	This entry will determine the behavior of backup routers within the VRRP group by controlling whether a higher priority backup router will preempt a lower priority Master router. A True entry, along with having the backup router's priority set higher than the masters priority, will set the backup router as the Master router. A False entry will disable the backup router from becoming the Master router. This setting must be consistent with all routers participating within the same VRRP group.
<b>Checking Critical IP</b>	Specifies the state of checking the status (active or inactive) of a critical IP address. Options to choose from are <b>Enabled</b> and <b>Disabled</b> .
<b>State</b>	Specifies the state of the virtual router function of the interface.
<b>Advertisement Interval</b>	Specifies the time interval used between sending advertisement messages.
<b>Critical IP Address</b>	Specifies an IP address of the physical device that will provide the most direct route to the Internet or other critical network connections from this virtual router. This must be a real IP address of a real device on the network. If the connection from the virtual router to this IP address fails, the virtual router will automatically disabled. A new Master will be elected from the backup routers participating in the VRRP group. Different critical IP addresses may be assigned to different routers participating in the VRRP group, and can therefore define multiple routes to the Internet or other critical network connections.

Click the **Apply** button to accept the changes made.

Click on the **<<Back** button to return to the previous window.

## VRRP Authentication Settings

This window is used to configure a virtual router authentication type on an interface.

To view the following window, click **L3 Features > VRRP > VRRP Authentication Settings**, as shown below:

VRRP Authentication Settings			<input checked="" type="radio"/> Safeguard
<b>Total Entries: 1</b>			
Interface Name	Authentication Type	Authentication Data	
System	None	*****	<b>Edit</b>

Figure 5-23 VRRP Authentication Settings window

Click the **Edit** button to re-configure a specific entry listed.

The fields that can be configured are described below:

Parameter	Description
<b>Authentication Type</b>	Specifies the VRRP's authentication type. Options to choose from are <b>None</b> , <b>Simple</b> and <b>IP</b> .  <b>None</b> - Selecting this parameter indicates that VRRP protocol exchanges will not be authenticated. <b>Simple</b> - Selecting this parameter will require the user to set a simple password in the Auth. Data field for comparing VRRP message packets received by a router. If the two passwords are not exactly the same, the packet will be dropped. <b>IP</b> - Selecting this parameter will require the user to set an IP for authentication in comparing VRRP messages received by the router. If the two values are inconsistent, the packet will be dropped.
<b>Authentication Data</b>	Specifies the authentication data used in the <b>Simple</b> and <b>IP</b> authentication algorithm. This entry must be consistent with all routers participating in the same IP interface.  <b>Simple</b> - Simple will require the user to enter an alphanumeric string of no more than eight characters to identify VRRP packets received by a router. <b>IP</b> - IP will require the user to enter an alphanumeric string of no more than sixteen characters to identify VRRP packets received by a router.

Click the **Apply** button to accept the changes made.

# Chapter 6 QoS

## **802.1p Settings**

### **Bandwidth Control**

### **Traffic Control Settings**

### **DSCP**

### **HOL Blocking Prevention**

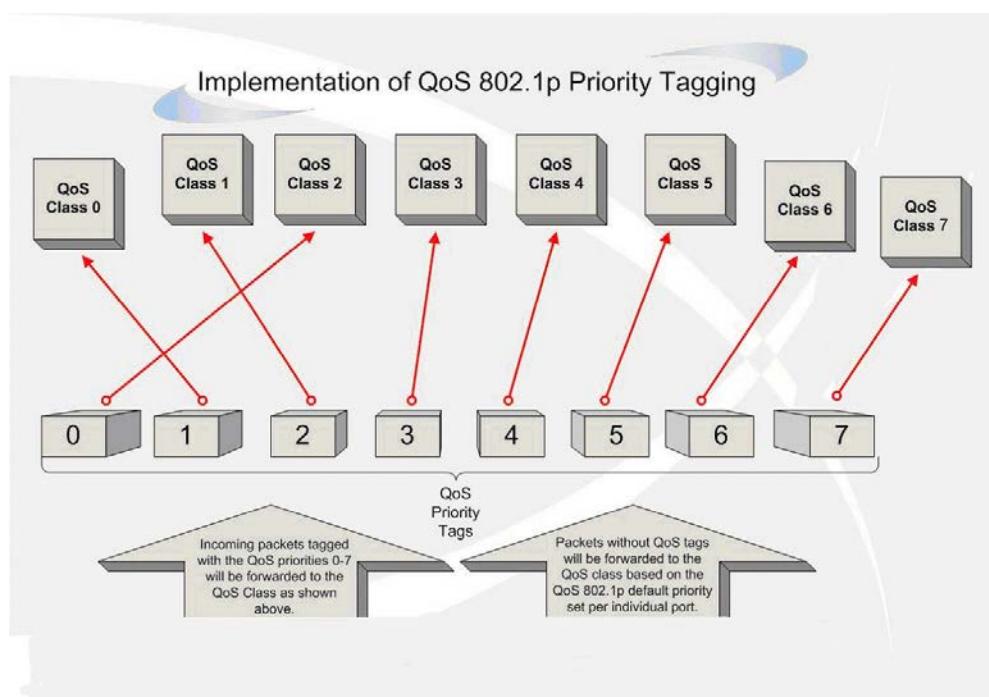

### **Scheduling Settings**

### **WRED**

The Switch supports 802.1p priority queuing Quality of Service. The following section discusses the implementation of QoS (Quality of Service) and benefits of using 802.1p priority queuing.

### **Advantages of QoS**

QoS is an implementation of the IEEE 802.1p standard that allows network administrators a method of reserving bandwidth for important functions that require a large bandwidth or have a high priority, such as VoIP (voice-over Internet Protocol), web browsing applications, file server applications or video conferencing. Not only can a larger bandwidth be created, but other less critical traffic can be limited, so excessive bandwidth can be saved. The Switch has separate hardware queues on every physical port to which packets from various applications can be mapped to, and, in turn prioritized. View the following map to see how the Switch implements basic 802.1P priority queuing.

**Figure 6-1 Mapping QoS on the Switch**

The picture above shows the default priority setting for the Switch. Class-7 has the highest priority of the seven priority classes of service on the Switch. In order to implement QoS, the user is required to instruct the Switch to examine the header of a packet to see if it has the proper identifying tag. Then the user may forward these tagged packets to designated classes of service on the Switch where they will be emptied, based on priority.

For example, let's say a user wishes to have a video conference between two remotely set computers. The administrator can add priority tags to the video packets being sent out, utilizing the Access Profile commands. Then, on

the receiving end, the administrator instructs the Switch to examine packets for this tag, acquires the tagged packets and maps them to a class queue on the Switch. Then in turn, the administrator will set a priority for this queue so that will be emptied before any other packet is forwarded. This result in the end user receiving all packets sent as quickly as possible, thus prioritizing the queue and allowing for an uninterrupted stream of packets, which optimizes the use of bandwidth available for the video conference.

## **Understanding QoS**

The Switch supports 802.1p priority queuing. The Switch has eight priority queues. These priority queues are numbered from 7 (Class 7) — the highest priority queue — to 0 (Class 0) — the lowest priority queue. The eight priority tags specified in IEEE 802.1p (p0 to p7) are mapped to the Switch's priority queues as follows:

- Priority 0 is assigned to the Switch's Q2 queue.
- Priority 1 is assigned to the Switch's Q0 queue.
- Priority 2 is assigned to the Switch's Q1 queue.
- Priority 3 is assigned to the Switch's Q3 queue.
- Priority 4 is assigned to the Switch's Q4 queue.
- Priority 5 is assigned to the Switch's Q5 queue.
- Priority 6 is assigned to the Switch's Q6 queue.
- Priority 7 is assigned to the Switch's Q7 queue.

For strict priority-based scheduling, any packets residing in the higher priority classes of service are transmitted first. Multiple strict priority classes of service are emptied based on their priority tags. Only when these classes are empty, are packets of lower priority transmitted.

For weighted round-robin queuing, the number of packets sent from each priority queue depends upon the assigned weight. For a configuration of eight CoS queues, A~H with their respective weight value: 8~1, the packets are sent in the following sequence: A1, B1, C1, D1, E1, F1, G1, H1, A2, B2, C2, D2, E2, F2, G2, A3, B3, C3, D3, E3, F3, A4, B4, C4, D4, E4, A5, B5, C5, D5, A6, B6, C6, A7, B7, A8, A1, B1, C1, D1, E1, F1, G1, H1.

For weighted round-robin queuing, if each CoS queue has the same weight value, then each CoS queue has an equal opportunity to send packets just like round-robin queuing.

For weighted round-robin queuing, if the weight for a CoS is set to 0, then it will continue processing the packets from this CoS until there are no more packets for this CoS. The other CoS queues that have been given a nonzero value, and depending upon the weight, will follow a common weighted round-robin scheme.

Remember that the Switch has eight configurable priority queues (and eight Classes of Service) for each port on the Switch.

## **802.1p Settings**

### **802.1p Default Priority Settings**

The Switch allows the assignment of a default 802.1p priority to each port on the Switch. This page allows the user to assign a default 802.1p priority to any given port on the switch that will insert the 802.1p priority tag to untagged packets received. The priority and effective priority tags are numbered from 0, the lowest priority, to 7, the highest priority. The effective priority indicates the actual priority assigned by RADIUS. If the RADIUS assigned value exceeds the specified limit, the value will be set at the default priority. For example, if the RADIUS assigns a limit of 8 and the default priority is 0, the effective priority will be 0.

To view the following window, click **QoS > 802.1p Settings > 802.1p Default Priority Settings**, as show below:

802.1p Default Priority Settings			
802.1p Default Priority Settings			
Unit	From Port	To Port	Priority
1	01	01	0

11	0	0	

**Figure 6-2 Default Priority Settings window**

The fields that can be configured are described below:

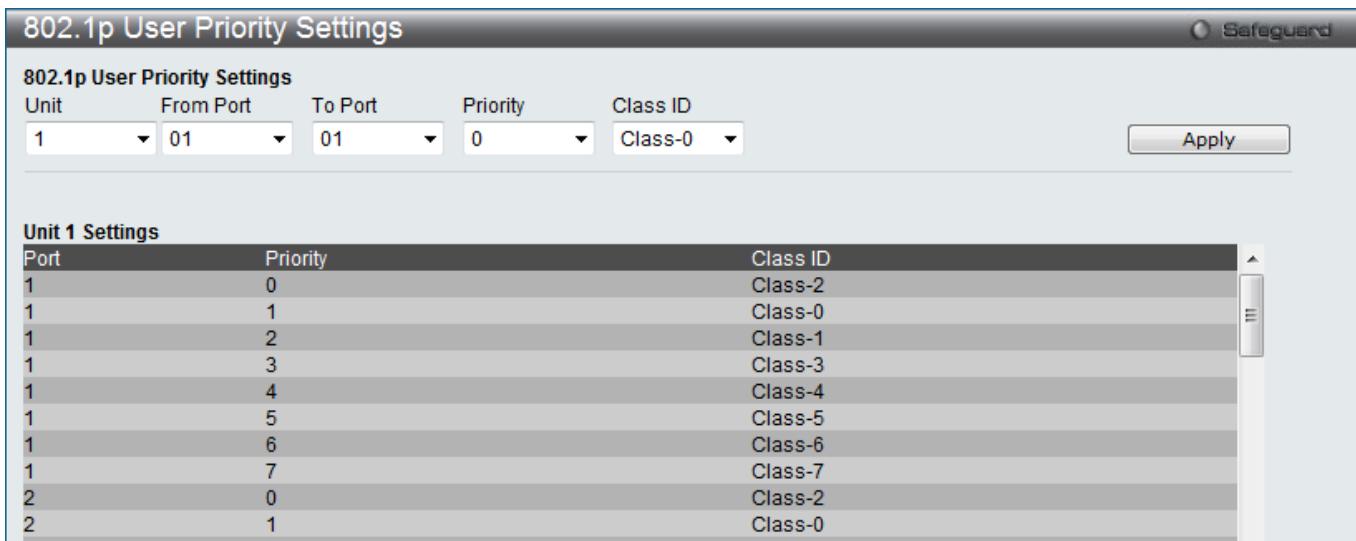

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the starting and ending ports to use.
<b>Priority</b>	Use the drop-down menu to select a value from 0 to 7.

Click the **Apply** button to accept the changes made.

## 802.1p User Priority Settings

The Switch allows the assignment of a class of service to each of the 802.1p priorities.

To view the following window, click **QoS > 802.1p Settings > 802.1p User Priority Settings**, as show below:

**Figure 6-3 802.1p User Priority Settings window**

Once a priority has been assigned to the port groups on the Switch, then a Class may be assigned to each of the eight levels of 802.1p priorities using the drop-down menus on this window. User priority mapping is not only for the default priority configured in the last page, but also for all the incoming tagged packets with 802.1p tag.

Click the **Apply** button to accept the changes made.

## Bandwidth Control

The bandwidth control settings are used to place a ceiling on the transmitting and receiving data rates for any selected port.

## Bandwidth Control Settings

The Effective RX/TX Rate refers to the actual bandwidth of the switch port, if it does not match the configured rate. This usually means that the bandwidth has been assigned by a higher priority resource, such as a RADIUS server. To view the following window, click **QoS > Bandwidth Control > Bandwidth Control Settings**, as show below:

**Bandwidth Control Settings**

**Safeguard**

Unit	From Port	To Port	Type	No Limit	Rate (8-10240000)	Kbit/sec	Apply
1	01	01	RX	Disabled			

**Unit 1 Settings**

Port	RX Rate (Kbit/sec)	TX Rate (Kbit/sec)	Effective RX (Kbit/sec)	Effective TX (Kbit/sec)
1	No Limit	No Limit	No Limit	No Limit
2	No Limit	No Limit	No Limit	No Limit
3	No Limit	No Limit	No Limit	No Limit
4	No Limit	No Limit	No Limit	No Limit
5	No Limit	No Limit	No Limit	No Limit
6	No Limit	No Limit	No Limit	No Limit
7	No Limit	No Limit	No Limit	No Limit
8	No Limit	No Limit	No Limit	No Limit
9	No Limit	No Limit	No Limit	No Limit
10	No Limit	No Limit	No Limit	No Limit
11	No Limit	No Limit	No Limit	No Limit
12	No Limit	No Limit	No Limit	No Limit
13	No Limit	No Limit	No Limit	No Limit
14	No Limit	No Limit	No Limit	No Limit
15	No Limit	No Limit	No Limit	No Limit
16	No Limit	No Limit	No Limit	No Limit
17	No Limit	No Limit	No Limit	No Limit
18	No Limit	No Limit	No Limit	No Limit
19	No Limit	No Limit	No Limit	No Limit
20	No Limit	No Limit	No Limit	No Limit
21	No Limit	No Limit	No Limit	No Limit
22	No Limit	No Limit	No Limit	No Limit
23	No Limit	No Limit	No Limit	No Limit
24	No Limit	No Limit	No Limit	No Limit
25	No Limit	No Limit	No Limit	No Limit

The Effective RX/TX Rate refers to the actual bandwidth of the switch port, if it does not match the configured rate. This usually means that the bandwidth has been assigned by a higher priority resource, such as a RADIUS server.

**Figure 6-4 Bandwidth Control Settings window**

The fields that can be configured or displayed are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menu to select the port range to use for this configuration.
<b>Type</b>	This drop-down menu allows a selection between <i>RX</i> (receive), <i>TX</i> (transmit), and <i>Both</i> . This setting will determine whether the bandwidth ceiling is applied to receiving, transmitting, or both receiving and transmitting packets.
<b>No Limit</b>	This drop-down menu allows the user to specify that the selected port will have no bandwidth limit or not. <b>NOTE:</b> If the configured number is larger than the port speed, it means no bandwidth limit.
<b>Rate (8-10240000)</b>	This field allows the input of the data rate that will be the limit for the selected port. The user may choose a rate between 8 and 10240000 Kbits per second.
<b>Effective RX</b>	If a RADIUS server has assigned the RX bandwidth, then it will be the effective RX bandwidth. The authentication with the RADIUS sever can be per port or per user. For per user authentication, there may be multiple RX bandwidths assigned if there are multiple users attached to this specific port. The final RX bandwidth will be the largest one among these multiple RX bandwidths.
<b>Effective TX</b>	If a RADIUS server has assigned the TX bandwidth, then it will be the effective TX bandwidth. The authentication with the RADIUS sever can be per port or per user. For per

	user authentication, there may be multiple TX bandwidths assigned if there are multiple users attached to this specific port. The final TX bandwidth will be the largest one among these multiple TX bandwidths.
--	--

Click the **Apply** button to accept the changes made.

## Queue Bandwidth Control Settings

To view the following window, click **QoS > Bandwidth Control > Queue Bandwidth Control Settings**, as show below:

The screenshot shows the 'Queue Bandwidth Control Settings' window. At the top, there is a header bar with a 'Safeguard' button. Below the header, there is a search bar and a table for configuring queue bandwidth settings. The table has columns for 'Unit', 'From Port', 'To Port', 'From Queue', 'To Queue', 'Min Rate (8-10240000)', and 'Max Rate (8-10240000)'. A 'No Limit' checkbox is checked under both 'Min Rate' and 'Max Rate'. An 'Apply' button is located at the bottom right of the table area. Below the table, there are three sections labeled 'Unit 1 Settings', 'Queue Bandwidth Control Table On Port 1', 'Queue Bandwidth Control Table On Port 2', and 'Queue Bandwidth Control Table On Port 3', each containing a table with 'Queue', 'Min Rate (Kbit/sec)', and 'Max Rate (Kbit/sec)' columns. All entries in these tables show 'No Limit'.

Queue Bandwidth Control Settings						
Unit	From Port	To Port	From Queue	To Queue	Min Rate (8-10240000)	Max Rate (8-10240000)
1	01	01	0	0	<input type="text"/> No Limit	<input type="text"/> No Limit
<b>Apply</b>						

Unit 1 Settings		
Queue Bandwidth Control Table On Port 1		
Queue	Min Rate (Kbit/sec)	Max Rate (Kbit/sec)
0	No Limit	No Limit
1	No Limit	No Limit
2	No Limit	No Limit
3	No Limit	No Limit
4	No Limit	No Limit
5	No Limit	No Limit
6	No Limit	No Limit
7	No Limit	No Limit

Queue Bandwidth Control Table On Port 2		
Queue	Min Rate (Kbit/sec)	Max Rate (Kbit/sec)
0	No Limit	No Limit
1	No Limit	No Limit
2	No Limit	No Limit
3	No Limit	No Limit
4	No Limit	No Limit
5	No Limit	No Limit
6	No Limit	No Limit
7	No Limit	No Limit

Queue Bandwidth Control Table On Port 3		
Queue	Min Rate (Kbit/sec)	Max Rate (Kbit/sec)
0	No Limit	No Limit
1	No Limit	No Limit
2	No Limit	No Limit
3	No Limit	No Limit

Figure 6-5 Queue Bandwidth Control Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menu to select the port range to use for this configuration.
<b>From Queue / To Queue</b>	Use the drop-down menu to select the queue range to use for this configuration.
<b>Min Rate (8-10240000)</b>	Specify the packet limit, in Kbps that the ports are allowed to receive. Tick the <b>No limit</b> check box to have unlimited rate of packets received by the specified queue.
<b>Max Rate (8-10240000)</b>	Enter the maximum rate for the queue. For no limit select the <b>No Limit</b> option.

Click the **Apply** button to accept the changes made.

**NOTE:** The minimum granularity of queue bandwidth control is 8 Kbit/sec. The system will adjust the number to the multiple of 8 automatically.

## Traffic Control Settings

On a computer network, packets such as Multicast packets and Broadcast packets continually flood the network as normal procedure. At times, this traffic may increase due to a malicious end station on the network or a malfunctioning device, such as a faulty network card. Thus, switch throughput problems will arise and consequently affect the overall performance of the switch network. To help rectify this packet storm, the Switch will monitor and control the situation.

Packet storms are monitored to determine if too many packets are flooding the network based on threshold levels provided by the user. Once a packet storm has been detected, the Switch will drop packets coming into the Switch until the storm has subsided. This method can be utilized by selecting the *Drop* option of the Action parameter in the window below.

The Switch will also scan and monitor packets coming into the Switch by monitoring the Switch's chip counter. This method is only viable for Broadcast and Multicast storms because the chip only has counters for these two types of packets. Once a storm has been detected (that is, once the packet threshold set below has been exceeded), the Switch will shut down the port to all incoming traffic, with the exception of STP BPDU packets, for a time period specified using the Count Down parameter.

If a Time Interval parameter times-out for a port configured for traffic control and a packet storm continues, that port will be placed in Shutdown Forever mode, which will cause a warning message to be sent to the Trap Receiver. Once in Shutdown Forever mode, the method of recovering the port is to manually recoup it using the **System Configuration > Port configuration > Port Settings** window or automatic recovering after the time period that is configured in the **Traffic Auto Recover Time** field. Select the disabled port and return its State to *Enabled* status. To utilize this method of Storm Control, choose the *Shutdown* option of the Action parameter in the window below.

Use this window to enable or disable storm control and adjust the threshold for multicast and broadcast storms.

To view the following window, click **QoS > Traffic Control Settings**, as show below:

**Traffic Control Settings**

**Traffic Control Settings**

Unit	1	To Port	01
From Port	01	Countdown (0 or 3-30)	0 min <input type="checkbox"/> Disabled
Action	Drop	Traffic Control Type	None
Time Interval (5-600)	5 sec	Multicast (0-255000)	131072 pkt/s
Broadcast (0-255000)	131072 pkt/s	Unicast (0-255000)	131072 pkt/s

**Apply**

---

**Traffic Trap Settings** None **Traffic Log Settings** Enabled **Apply**

---

**Traffic Auto Recover Time (0-65535)** 0 min **Apply**

---

**Unit 1 Settings**

Port	Traffic Control Type	Action	Broadcast	Multicast	Unicast	Countdown	Interval	Shutdown Forever
1	None	Drop	131072	131072	131072	0	5	
2	None	Drop	131072	131072	131072	0	5	
3	None	Drop	131072	131072	131072	0	5	
4	None	Drop	131072	131072	131072	0	5	
5	None	Drop	131072	131072	131072	0	5	
6	None	Drop	131072	131072	131072	0	5	
7	None	Drop	131072	131072	131072	0	5	
8	None	Drop	131072	131072	131072	0	5	
9	None	Drop	131072	131072	131072	0	5	
10	None	Drop	131072	131072	131072	0	5	

**Note:** For unicast storm traffic, the violated action is always 'drop'.

**Figure 6-6 Traffic Control Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menu to select the port range to use for this configuration.
<b>Action</b>	<p>Select the method of traffic control from the drop-down menu. The choices are:</p> <p><i>Drop</i> – Utilizes the hardware Traffic Control mechanism, which means the Switch's hardware will determine the Packet Storm based on the Threshold value stated and drop packets until the issue is resolved.</p> <p><i>Shutdown</i> – Utilizes the Switch's software Traffic Control mechanism to determine the Packet Storm occurring. Once detected, the port will deny all incoming traffic to the port except STP BPDU packets, which are essential in keeping the Spanning Tree operational on the Switch. If the Count Down timer has expired and yet the Packet Storm continues, the port will be placed in Shutdown Forever mode and is no longer operational until the port recovers after 5 minutes automatically or the user manually resets the port using the Port Settings window (<b>System Configuration &gt; Port Configuration&gt; Port Settings</b>). Choosing this option obligates the user to configure the Time Interval setting as well, which will provide packet count samplings from the Switch's chip to determine if a Packet Storm is occurring.</p>

<b>Countdown (0 or 3-30)</b>	The Count Down timer is set to determine the amount of time, in minutes, that the Switch will wait before shutting down the port that is experiencing a traffic storm. This parameter is only useful for ports configured as <i>Shutdown</i> in their <b>Action</b> field and therefore will not operate for hardware-based Traffic Control implementations. The possible time settings for this field are 0 and 3 to 30 minutes. Tick the <b>Disabled</b> check box, and the port will be shut down immediately when detecting storm.
<b>Time Interval (5-600)</b>	The Time Interval will set the time between Multicast and Broadcast packet counts sent from the Switch's chip to the Traffic Control function. These packet counts are the determining factor in deciding when incoming packets exceed the Threshold value. The Time Interval may be set between 5 and 600 seconds, with a default setting of 5 seconds.
<b>Threshold (0-255000)</b>	Specifies the maximum number of packets per second that will trigger the Traffic Control function to commence. The configurable threshold range is from 0-255000 with a default setting of 131072 packets per second.
<b>Traffic Control Type</b>	Specifies the desired Storm Control Type: <i>None</i> , <i>Broadcast</i> , <i>Multicast</i> , <i>Unicast</i> , <i>Broadcast + Multicast</i> , <i>Broadcast + Unicast</i> , <i>Multicast + Unicast</i> , and <i>Broadcast + Multicast + Unicast</i> .
<b>Broadcast (0-255000)</b>	Enter the number of broadcast packets per second received by the Switch that will trigger the storm traffic control measure.
<b>Multicast (0-255000)</b>	Enter the number of multicast packets per second received by the Switch that will trigger the storm traffic control measure.
<b>Unicast (0-255000)</b>	Enter the number of unicast packets per second received by the Switch that will trigger the storm traffic control measure.
<b>Traffic Trap Settings</b>	Enable sending of Storm Trap messages when the type of action taken by the Traffic Control function in handling a Traffic Storm is one of the following: <i>None</i> – Will send no Storm trap warning messages regardless of action taken by the Traffic Control mechanism. <i>Storm Occurred</i> – Will send Storm Trap warning messages upon the occurrence of a Traffic Storm only. <i>Storm Cleared</i> – Will send Storm Trap messages when a Traffic Storm has been cleared by the Switch only. <i>Both</i> – Will send Storm Trap messages when a Traffic Storm has been both detected and cleared by the Switch. This function cannot be implemented in the hardware mode. (When <i>Drop</i> is chosen for the Action parameter)
<b>Traffic Log Settings</b>	Use the drop-down menu to enable or disable the function. If enabled, the traffic control states are logged when a storm occurs and when a storm is cleared. If the log state is disabled, the traffic control events are not logged.
<b>Traffic Auto Recover Time (0-65535)</b>	Enter the time allowed for auto recovery from shutdown for a port. The default value is 0, which means there is no auto recovery and the port remains in shutdown forever mode. This requires manual entry of the CLI command <b>config ports [ &lt;portlist&gt;   all ] state enable</b> to return the port to a forwarding state.

Click the **Apply** button to accept the changes made for each individual section.

**NOTE:** Traffic Control cannot be implemented on ports that are set for Link Aggregation (Port Trunking).

**NOTE:** Ports that are in the Shutdown Forever mode will be seen as Discarding in Spanning Tree windows and implementations though these ports will still be forwarding BPDUs to the Switch's CPU.

**NOTE:** Ports that are in Shutdown Forever mode will be seen as link down in all windows and screens until the user recovers these ports.

**NOTE:** The minimum granularity of storm control on a GE port is 1pps.

## DSCP

### DSCP Trust Settings

This window is to configure the DSCP trust state of ports. When ports are under the DSCP trust mode, the switch will insert the priority tag to untagged packets by using the DSCP Map settings instead of the default port priority.

To view the following window, click **QoS > DSCP > DSCP Trust Settings**, as show below:

DSCP Trust Settings				Safeguard																																																		
Unit	From Port	To Port	State																																																			
1	01	01	Disabled	<input type="button" value="Apply"/>

Figure 6-7 DSCP Trust Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you want to configure.
<b>From Port / To Port</b>	Use the drop-down menu to select a range of port to configure.
<b>State</b>	Enable/disable to trust DSCP. By default, DSCP trust is disabled.

Click the **Apply** button to accept the changes made.

## DSCP Map Settings

The mapping of DSCP to queue will be used to determine the priority of the packet (which will be then used to determine the scheduling queue) when the port is in DSCP trust state.

The DSCP-to-DSCP mapping is used in the swap of DSCP of the packet when the packet is ingresses to the port. The remaining processing of the packet will base on the new DSCP. By default, the DSCP is mapped to the same DSCP.

To view the following window, click **QoS > DSCP > DSCP Map Settings**, as show below:

Port	0	1	2	3	4	5	6	7
1	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
2	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
3	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63

Figure 6-8 DSCP Map Settings - DSCP Priority window

To view the following window, click **QoS > DSCP > DSCP Map Settings** and select **DSCP DSCP** from the DSCP Map drop-down menu, as show below:

The screenshot shows the 'DSCP Map Settings' interface. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), 'To Port' (set to 01), and a 'DSCP Map' dropdown (set to 'DSCP DSCP'). Below these are two input fields: 'DSCP List (0-63)' and 'DSCP (0-63)', both currently empty. An 'Apply' button is to the right of these fields. Underneath is a 'Port' dropdown set to 01 and a 'Find' button. The main area is titled 'Unit 1 Settings' and contains a 7x10 grid table:

Port	0	1	2	3	4	5	6	7	8	9
0	0	1	2	3	4	5	6	7	8	9
1	10	11	12	13	14	15	16	17	18	19
2	20	21	22	23	24	25	26	27	28	29
3	30	31	32	33	34	35	36	37	38	39
4	40	41	42	43	44	45	46	47	48	49
5	50	51	52	53	54	55	56	57	58	59
6	60	61	62	63						

Figure 6-9 DSCP Map Settings - DSCP DSCP window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you want to configure.
<b>From Port / To Port</b>	Use the drop-down menu to select a range of port to configure.
<b>DSCP Map</b>	Use the drop-down menu to select one of two options: <i>DSCP Priority</i> – Specify a list of DSCP values to be mapped to a specific priority. <i>DSCP DSCP</i> – Specify a list of DSCP value to be mapped to a specific DSCP.
<b>DSCP List (0-63)</b>	Enter a DSCP List value.
<b>Priority</b>	Use the drop-down menu to select a Priority value. This appears when selecting <i>DSCP Priority</i> in the <b>DSCP Map</b> drop-down menu.
<b>DSCP (0-63)</b>	Enter a DSCP value. This appears when selecting <i>DSCP DSCP</i> in the <b>DSCP Map</b> drop-down menu.
<b>Port</b>	Use the drop-down menu to select a port.

Click the **Apply** button to accept the changes made.

Click the **Find** button to locate a specific entry based on the information entered.

## HOL Blocking Prevention

HOL (Head of Line) Blocking happens when one of the destination ports of a broadcast or multicast packet are busy. The switch will hold this packet in the buffer while the other destination port will not transmit the packet even they are not busy.

The HOL Blocking Prevention will ignore the busy port and forward the packet directly to have lower latency and better performance.

On this page the user can enable or disable HOL Blocking Prevention.

To view the following window, click **QoS > HOL Blocking Prevention**, as show below:

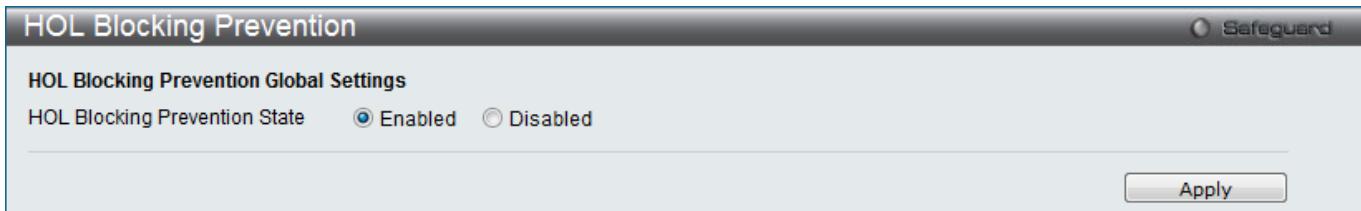

Figure 6-10 HOL blocking Prevention window

The fields that can be configured are described below:

Parameter	Description
<b>HOL Blocking Prevention State</b>	Click the radio buttons to enable or disable the HOL blocking prevention global settings.

Click the **Apply** button to accept the changes made.

## Scheduling Settings

### QoS Scheduling

This window allows the user to configure the way the Switch will map an incoming packet per port based on its 802.1p user priority, to one of the eight available hardware priority queues available on the Switch.

To view this window, click **QoS > Scheduling Settings > QoS Scheduling** as shown below:

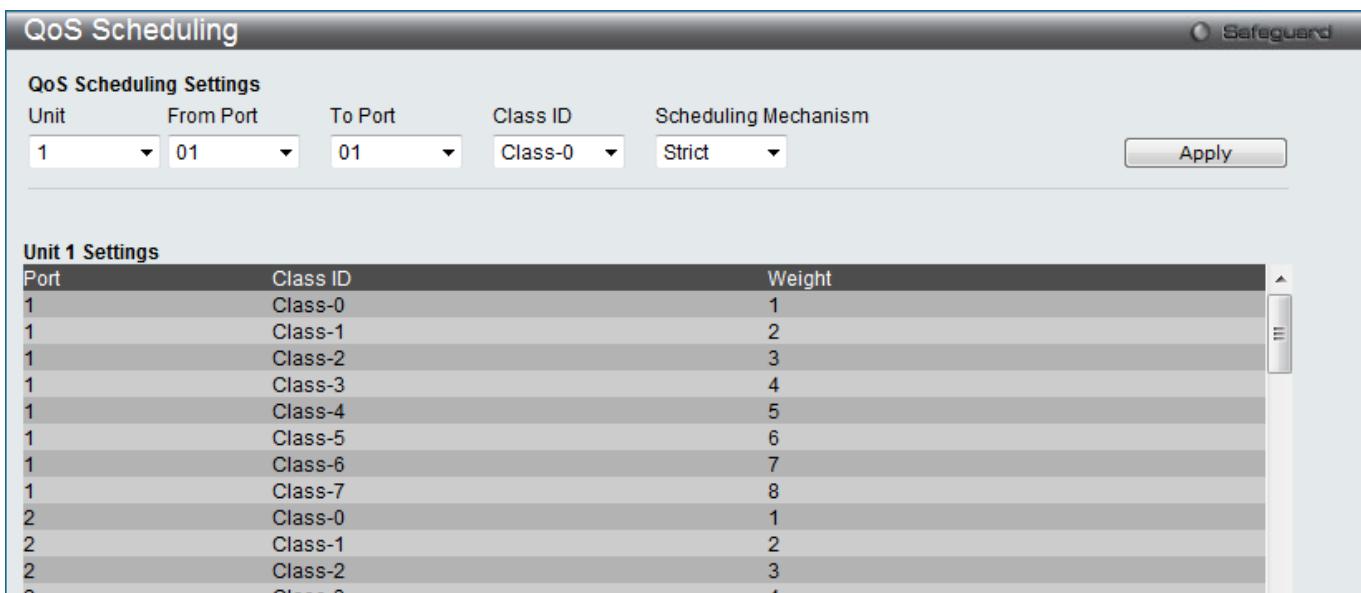

Figure 6-11 QoS Scheduling window

The following parameters can be configured:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Enter the port or port list you wish to configure.

<b>Class ID</b>	Select the Class ID, from 0-7 to configure for the QoS parameters.
<b>Scheduling Mechanism</b>	<p><i>Strict</i> – The highest class of service is the first to process traffic. That is, the highest class of service will finish before other queues empty.</p> <p><i>Weight</i> – Use the weighted round-robin (<i>WRR</i>) algorithm to handle packets in an even distribution in priority classes of service.</p>

Click the **Apply** button to accept the changes made.

## QoS Scheduling Mechanism

Changing the output scheduling used for the hardware queues in the Switch can customize QoS. As with any changes to QoS implementation, careful consideration should be given to how network traffic in lower priority queues are affected. Changes in scheduling may result in unacceptable levels of packet loss or significant transmission delays. If you choose to customize this setting, it is important to monitor network performance, especially during peak demand, as bottlenecks can quickly develop if the QoS settings are not suitable.

To view this window, click **QoS > Scheduling Settings > QoS Scheduling Mechanism** as shown below:

Unit 1 Settings	
Port	Mode
1	Strict
2	Strict
3	Strict
4	Strict
5	Strict
6	Strict

Figure 6-12 QoS Scheduling Mechanism

The following parameters can be configured:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Enter the port or port list you wish to configure.
<b>Scheduling Mechanism</b>	<p><i>Strict</i> – The highest class of service is the first to process traffic. That is, the highest class of service will finish before other queues empty.</p> <p><i>Weighted Round Robin</i> – Use the weighted round-robin algorithm to handle packets in an even distribution in priority classes of service.</p>

Click the **Apply** button to accept the changes made.

**NOTE:** The settings you assign to the queues, numbers 0-7, represent the IEEE 802.1p priority tag number. Do not confuse these settings with port numbers.

## WRED

### WRED Port Settings

This window is used to configure the WRED state and its port settings.

To view the following window, click **QoS > WRED > WRED Port Settings**, as show below:

**WRED Settings**

WRED Global Settings
 Enabled
 Disabled
Apply

---

**WRED Port Settings**

Unit	From Port	To Port	Class ID	Weight (0-15)	Profile		Apply

0	9	1	default

Figure 6-13 WRED Settings window

The fields that can be configured are described below:

Parameter	Description
<b>WRED State</b>	Click to enable or disable the WRED global state.
<b>Unit</b>	Select the unit you want to configure.
<b>From Port / To Port</b>	Use the drop-down menu to select the port range to use for this configuration.
<b>Class ID</b>	Use the drop-down menu to select the hardware priority.

<b>Weight (0-15)</b>	Specify the weight in the average queue size calculation.
<b>Profile</b>	<p>Use the drop-down menu to select the profile to be used for WRED ports and queue.</p> <p><i>Default</i> – Specify the default profile to be used.</p> <p><i>Profile ID</i> – Select and enter a profile ID to be used.</p> <p><i>Profile Name</i> – Select and enter a profile name to be used.</p>

Click the **Apply** button to accept the changes made for each individual section.

## WRED Profile Settings

This window is used to configure the WRED profile settings.

To view the following window, click **QoS > WRED > WRED Profile Settings**, as show below:

The screenshot shows the 'WRED Profile Settings' window with the following sections:

- Create WRED Profile:** Fields for Profile ID (2-128) and Profile Name (Max: 32 characters), with Add, Delete, and Delete All buttons.
- Configure WRED Profile:** A table with columns: Profile (Default dropdown), Packet Type (TCP dropdown), Packet Colour (Green dropdown), Min Threshold (0-100), Max Threshold (0-100), and Max Drop Rate (0-100). The row shows values: Default, TCP, Green, 50, 100, 50. An Apply button is at the bottom right.
- WRED ProfileTable:** A table showing the current profile configuration. It has a header row: Total Current Profile Number: 1, WRED Profile ID: 1, Profile Name: default. The data rows are:
 

Packet Type	Min-Threshold	Max-Threshold	Max-Drop-Rate
TCP-Green	50	100	50
TCP-Yellow	50	100	50
TCP-Red	50	100	50
Non-TCP-Green	50	100	50
Non-TCP-Yellow	50	100	50
Non-TCP-Red	50	100	50

Figure 6-14 WRED Profile Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID (2-128)</b>	Enter a WRED profile ID to be added or deleted.
<b>Profile Name</b>	Enter a WRED profile name to be added or deleted.
<b>Profile</b>	<p>Use the drop-down menu to select the profile to be used for WRED ports and queue.</p> <p><i>Default</i> – Specify the default profile to be used.</p> <p><i>Profile ID</i> – Select and enter a profile ID to be used.</p> <p><i>Profile Name</i> – Select and enter a profile name to be used.</p>
<b>Packet Type</b>	Select the packet type, TCP or Non-TCP to be dropped.

<b>Packet Colour</b>	Select the packet color, Green, yellow or red, to be dropped.
<b>Min Threshold (0-100)</b>	Enter the minimum threshold value used. If the queue size is higher than this value, then the color yellow will be assigned to it. If the queue size is lower than this value, then the color green will be assigned to it and then it will be guaranteed not to be dropped. Yellow packet behavior depends on the profile setting for this color.
<b>Max Threshold (0-100)</b>	Enter the maximum threshold value used. If the queue size is lower than this value, then the color yellow will be assigned to it. If the queue size is higher than this value, then the color red will be assigned to it and then it will be dropped. Yellow packet behavior depends on the profile setting for this color.
<b>Max Drop Rate (0-100)</b>	Enter the maximum drop rate value.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

Click the **Apply** button to accept the changes made.

Click the **Find** button to locate a specific entry based on the information entered.

# Chapter 7     ACL

**ACL Configuration Wizard**

**Access Profile List**

**CPU Access Profile List**

**ACL Finder**

**ACL Flow Meter**

**Egress Access Profile List**

**Egress ACL Flow Meter**

## ACL Configuration Wizard

The ACL Configuration Wizard will aid the user in the creation of access profiles and ACL Rules automatically by simply inputting the address or service type and the action needed. It saves administrators a lot of time.

To view this window, click **ACL > ACL Configuration Wizard** as shown below:

The screenshot shows the 'ACL Configuration Wizard' window. At the top left is the title 'ACL Configuration Wizard'. On the right side, there is a small circular icon labeled 'Safeguard' with a checkmark. The main area is titled 'General ACL Rules'. It contains several configuration fields:

- Type:** A dropdown menu set to 'Normal'.
- Profile Name:** An empty text input field.
- Profile ID (1-6):** An empty text input field.
- Access ID (1-256):** An empty text input field.
- From:** A dropdown menu set to 'Any'.
- To:** A dropdown menu set to 'Any'.
- Action:** A dropdown menu set to 'Permit'.
- Option:** A dropdown menu set to 'Change 1p Priority'.
- (0-7):** An empty text input field next to the priority dropdown.
- Apply To:** A dropdown menu set to 'Ports'.
- (e.g.: 1, 4-6):** An empty text input field next to the port range dropdown.

At the bottom left of the window, there is a note in red text: 'Note: The ACL wizard will create the access profile and rule automatically. The access profiles and rules can be manually configured in the Access Profile List.' On the far right, there is a grey 'Apply' button.

Figure 7-1 ACL Configuration Wizard window

The fields that can be configured are described below:

Parameter	Description
<b>Type</b>	Use the drop-down menu to select the general ACL Rule types: <i>Normal</i> – Selecting this option will create a Normal ACL Rule. <i>CPU</i> – Selecting this option will create a CPU ACL Rule. <i>Egress</i> - Selecting this option will create an Egress ACL Rule.
<b>Profile Name</b>	After selecting to configure a <b>Normal</b> type rule, the user can enter the Profile Name for the

	new rule here.
<b>Profile ID</b>	Enter the Profile ID for the new rule.
<b>Access ID</b>	Enter the Access ID for the new rule. Selecting the <b>Auto Assign</b> option will allow the switch to automatically assign an unused access ID to this rule.
<b>From / To</b>	This rule can be created to apply to four different categories: <i>Any</i> – Selecting this option will include any starting category to this rule. <i>MAC Address</i> – Selecting this option will allow the user to enter a range of MAC addresses for this rule. <i>IPv4 Address</i> – Selecting this option will allow the user to enter a range of IPv4 addresses for this rule. <i>IPv6</i> – Selecting this option will allow the user to enter a range of IPv6 addresses for this rule.
<b>Action</b>	Select <i>Permit</i> to specify that the packets that match the access profile are forwarded by the Switch, according to any additional rule added (see below). Select <i>Deny</i> to specify that the packets that match the access profile are not forwarded by the Switch and will be filtered. Select <i>Mirror</i> to specify that packets that match the access profile are mirrored to a port defined in the mirror port section. Port Mirroring must be enabled and a target port must be set.
<b>Option</b>	After selecting the <b>Permit</b> action, the user can select one of the following options: <i>Change 1p Priority</i> – Here the user can enter the 1p priority value. <i>Replace DSCP</i> – Here the user can enter the DSCP value. <i>Replace ToS Precedence</i> – Here the user can enter the ToS Precedence value.
<b>Apply To</b>	Use the drop-down menu to select and enter the information that this rule will be applied to. <i>Ports</i> – Enter a port number or a port range. <i>VLAN Name</i> – Enter a VLAN name. <i>VLAN ID</i> – Enter a VLAN ID.

Click the **Apply** button to accept the changes made.

**NOTE:** The Switch will use one minimum mask to cover all the terms that user input, however, some extra bits may also be masked at the same time. To optimize the ACL profile and rules, please use manual configuration.

## Access Profile List

Access profiles allow you to establish criteria to determine whether the Switch will forward packets based on the information contained in each packet's header.

To view Access Profile List window, click **ACL > Access Profile List** as shown below:

The Switch supports four Profile Types, Ethernet ACL, IPv4 ACL, IPv6 ACL, and Packet Content ACL.

Creating an access profile is divided into two basic parts. The first is to specify which part or parts of a frame the Switch will examine, such as the MAC source address or the IP destination address. The second part is entering the criteria the Switch will use to determine what to do with the frame. The entire process is described below in two parts.

Users can display the currently configured Access Profiles on the Switch.

Access Profile List			Safeguard		
Add ACL Profile		Delete All		Total User Set Rule Entries / Total Used HW Entries / Total Available HW Entries: 0 / 0 / 1536	
Profile ID	Profile Name	Profile Type			
1	EthernetACL	Ethernet	Show Details	Add/View Rules	Delete
2	IPv4ACL	IP	Show Details	Add/View Rules	Delete
3	IPv6ACL	IPv6	Show Details	Add/View Rules	Delete
4	PCACL	User Defined	Show Details	Add/View Rules	Delete

1/1 1 Go

**Figure 7-2 Access Profile List window**

Click the **Add ACL Profile** button to add an entry to the **Access Profile List**.

Click the **Delete All** button to remove all access profiles from this table.

Click the **Show Details** button to display the information of the specific profile ID entry.

Click the **Add/View Rules** button to view or add ACL rules within the specified profile ID.

Click the **Delete** button to remove the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

There are four **Add Access Profile** windows;

- one for Ethernet (or MAC address-based) profile configuration,
- one for IPv6 address-based profile configuration,
- one for IPv4 address-based profile configuration, and
- one for packet content profile configuration.

## Adding an Ethernet ACL Profile

The window shown below is the Add ACL Profile window for Ethernet. To use specific filtering masks in this ACL profile, click the packet filtering mask field to highlight it red. This will add more fields to the mask.

After clicking the **Add ACL Profile** button, the following page will appear:

The screenshot shows the 'Add ACL Profile' window for an 'Ethernet ACL'. At the top, there are fields for 'Profile ID (1-6)' (set to 1) and 'Profile Name' (set to 'EthernetACL'). Below these are options for 'Select ACL Type': 'Ethernet ACL' (selected, indicated by a green dot), 'Tagged' (selected, indicated by a blue dropdown arrow), and three other options ('IPv4 ACL', 'IPv6 ACL', 'Packet Content ACL') which are unselected (indicated by a grey dot). A note below says 'You can select the field in the packet to create filtering mask'. The main area contains tabs for 'MAC Address', 'VLAN', '802.1p', and 'Ethernet Type'. Under 'MAC Address', there are checkboxes for 'Source MAC Mask' and 'Destination MAC Mask', both of which are unselected. Under 'VLAN', there are checkboxes for 'VLAN' and 'VLAN Mask (0-FFF)', where 'VLAN' is unselected and 'VLAN Mask' is selected. Under '802.1p', there is a single checkbox for '802.1p' which is unselected. Under 'Ethernet Type', there is a single checkbox for 'Ethernet Type' which is unselected. At the bottom right are buttons for 'Save' (disabled), 'Back', and 'Create'.

Figure 7-3 Add ACL Profile window (Ethernet ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID (1-6)</b>	Enter a unique identifier number for this profile set. This value can be set from 1 to 6.
<b>Profile Name</b>	Enter a profile name for the profile created.
<b>Select ACL Type</b>	Select profile based on Ethernet (MAC Address), IPv4 address, IPv6 address, or packet content. This will change the window according to the requirements for the type of profile. Select Ethernet ACL to instruct the Switch to examine the layer 2 part of each packet header. Select IPv4 ACL to instruct the Switch to examine the IPv4 address in each frame's header. Select IPv6 ACL to instruct the Switch to examine the IPv6 address in each frame's header. Select Packet Content to instruct the Switch to examine the packet content in each frame's header.
<b>Source MAC Mask</b>	Enter a MAC address mask for the source MAC address, e.g. FF-FF-FF-FF-FF-FF.
<b>Destination MAC Mask</b>	Enter a MAC address mask for the destination MAC address, e.g. FF-FF-FF-FF-FF-FF.
<b>802.1Q VLAN</b>	Selecting this option instructs the Switch to examine the 802.1Q VLAN identifier of each packet header and use this as the full or partial criterion for forwarding.
<b>802.1p</b>	Selecting this option instructs the Switch to examine the 802.1p priority value of each packet header and use this as the, or part of the criterion for forwarding.

<b>Ethernet Type</b>	Selecting this option instructs the Switch to examine the Ethernet type value in each frame's header.
----------------------	---

Click the **Select** button to select an ACL type.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the **Create** button to create a profile.

After clicking the **Show Details** button, the following page will appear:

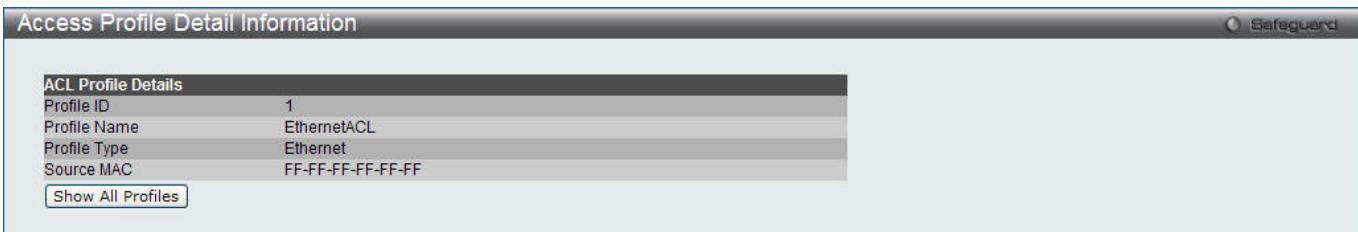

Figure 7-4 Access Profile Detail Information window (Ethernet ACL)

Click the **Show All Profiles** button to navigate back to the **Access Profile List** window.

After clicking the **Add/View Rules** button, the following page will appear:

Figure 7-5 Access Rule List window (Ethernet ACL)

Click the **<<Back** button to return to the previous page.

Click the **Add Rule** button to create a new ACL rule in this profile.

Click the **Show Details** button to view more information about the specific rule created.

Click the **Delete Rules** button to remove the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

After clicking the **Add Rule** button, the following page will appear:

**Profile Information**

Profile ID	1	Profile Name	EthernetACL
Profile Type	Ethernet	Source MAC	FF-FF-FF-FF-FF-FF

---

**Rule Detail**  
(Keep the input field blank to specify that the corresponding option does not matter).

Access ID (1-256)	1 <input type="checkbox"/> Auto Assign
Source MAC Address	<input type="text"/> (e.g.: 00-00-00-00-FF-FF)
Source MAC Address Mask	<input type="text"/>
Rule Action	<input type="button" value="Permit"/>
Action	<input type="button" value="Permit"/>
Priority (0-7)	<input type="checkbox"/>
Replace Priority	<input type="checkbox"/>
Replace DSCP (0-63)	<input type="checkbox"/>
Replace ToS Precedence (0-7)	<input type="checkbox"/>
Time Range Name	<input type="text"/>
Counter	<input type="button" value="Disabled"/>
Mirror Group ID (1-4)	<input type="text"/>
Ports	<input type="text"/> (e.g.: 1:1, 1:4-1:6, 1:9)

**Figure 7-6 Add Access Rule window (Ethernet ACL)**

The fields that can be configured are described below:

Parameter	Description
<b>Access ID (1-256)</b>	Type in a unique identifier number for this access. This value can be set from 1 to 256. <b>Auto Assign</b> – Tick the check box will instruct the Switch to automatically assign an Access ID for the rule being created.
<b>Action</b>	Select <i>Permit</i> to specify that the packets that match the access profile are forwarded by the Switch, according to any additional rule added (see below). Select <i>Deny</i> to specify that the packets that match the access profile are not forwarded by the Switch and will be filtered. Select <i>Mirror</i> to specify that packets that match the access profile are mirrored to a port defined in the config mirror port command. Port Mirroring must be enabled and a target port must be set.
<b>Priority (0-7)</b>	Tick the corresponding check box if you want to re-write the 802.1p default priority of a packet to the value entered in the Priority field, which meets the criteria specified previously in this command, before forwarding it on to the specified CoS queue. Otherwise, a packet will have its incoming 802.1p user priority re-written to its original value before being forwarded by the Switch. For more information on priority queues, CoS queues and mapping for 802.1p, see the QoS section of this manual.
<b>Replace Priority</b>	Tick this check box to replace the Priority value in the adjacent field.
<b>Replace DSCP (0-63)</b>	Select this option to instruct the Switch to replace the DSCP value (in a packet that meets the selected criteria) with the value entered in the adjacent field. When an ACL rule is added to change both the priority and DSCP of an IPv4 packet, only one of them can be modified due to a chip limitation. Currently the priority is changed when both the

	priority and DSCP are set to be modified.
<b>Replace ToS Precedence (0-7)</b>	Specify that the IP precedence of the outgoing packet is changed with the new value. If used without an action priority, the packet is sent to the default traffic class.
<b>Time Range Name</b>	Tick the check box and enter the name of the Time Range settings that has been previously configured in the <b>Time Range Settings</b> window. This will set specific times when this access rule will be implemented on the Switch.
<b>Counter</b>	Here the user can select the counter. By checking the counter, the administrator can see how many times that the rule was hit.
<b>Ports</b>	When a range of ports is to be configured, the Auto Assign check box MUST be ticked in the Access ID field of this window. If not, the user will be presented with an error message and the access rule will not be configured.
<b>VLAN Name</b>	Specify the VLAN name to apply to the access rule.
<b>VLAN ID</b>	Specify the VLAN ID to apply to the access rule.

Click the <<Back button to discard the changes made and return to the previous page.

Click the **Apply** button to accept the changes made.

After clicking the **Show Details** button in the **Access Rule List**, the following page will appear:

ACL Rule Details	
Profile ID	1
Access ID	1
Profile Type	Ethernet
Action	Permit
Ports	1:10
Source MAC	00-00-00-FF-FF

**Show All Rules**

Figure 7-7 Access Rule Detail Information window (Ethernet ACL)

Click the **Show All Rules** button to navigate back to the Access Rule List.

## Adding an IPv4 ACL Profile

The window shown below is the Add ACL Profile window for IPv4. To use specific filtering masks in this ACL profile, click the packet filtering mask field to highlight it red. This will add more filed to the mask.

After clicking the **Add ACL Profile** button, the following page will appear:

Add ACL Profile

Profile ID (1-6)  Profile Name

Select ACL Type  
 Ethernet ACL  
 IPv4 ACL  
 IPv6 ACL  
 Packet Content ACL

You can select the field in the packet to create filtering mask

L2 Header      VLAN      IPv4 DSCP      IPv4 Address      ICMP

**802.1Q VLAN**

VLAN  
 VLAN Mask (0-FFF)

**IPv4 DSCP**

**IPv4 Address**

Source IP Mask   
 Destination IP Mask

**ICMP**

ICMP  
 ICMP Type  ICMP Code

<<Back      Create

Figure 7-8 Add ACL Profile window (IPv4 ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID (1-6)</b>	Enter a unique identifier number for this profile set. This value can be set from 1 to 6.
<b>Select ACL Type</b>	Select profile based on Ethernet (MAC Address), IPv4 address, IPv6 address, or packet content. This will change the window according to the requirements for the type of profile. Select Ethernet ACL to instruct the Switch to examine the layer 2 part of each packet header. Select IPv4 ACL to instruct the Switch to examine the IPv4 address in each frame's header. Select IPv6 ACL to instruct the Switch to examine the IPv6 address in each frame's header. Select Packet Content to instruct the Switch to examine the packet content in each frame's header.
<b>802.1Q VLAN</b>	Selecting this option instructs the Switch to examine the 802.1Q VLAN identifier of each packet header and use this as the full or partial criterion for forwarding.
<b>IPv4 DSCP</b>	Selecting this option instructs the Switch to examine the DiffServ Code part of each packet header and use this as the, or part of the criterion for forwarding.
<b>IPv4 Source IP Mask</b>	Enter an IP address mask for the source IP address, e.g. 255.255.255.255.
<b>IPv4 Destination IP Mask</b>	Enter an IP address mask for the destination IP address, e.g. 255.255.255.255.
<b>Protocol</b>	Selecting this option instructs the Switch to examine the protocol type value in each

	<p>frame's header. Then the user must specify what protocol(s) to include according to the following guidelines:</p> <p>Select <i>ICMP</i> to instruct the Switch to examine the Internet Control Message Protocol (ICMP) field in each frame's header.</p> <p>Select <i>Type</i> to further specify that the access profile will apply an ICMP type value, or specify <i>Code</i> to further specify that the access profile will apply an ICMP code value.</p> <p>Select <i>IGMP</i> to instruct the Switch to examine the Internet Group Management Protocol (IGMP) field in each frame's header.</p> <p>Select <i>Type</i> to further specify that the access profile will apply an IGMP type value.</p> <p>Select <i>TCP</i> to use the TCP port number contained in an incoming packet as the forwarding criterion. Selecting TCP requires that you specify a source port mask and/or a destination port mask.</p> <p><i>src port mask</i> - Specify a TCP port mask for the source port in hex form (hex 0x0-0xffff), which you wish to filter.</p> <p><i>dst port mask</i> - Specify a TCP port mask for the destination port in hex form (hex 0x0-0xffff) which you wish to filter.</p> <p><i>flag bit</i> - The user may also identify which flag bits to filter. Flag bits are parts of a packet that determine what to do with the packet. The user may filter packets by filtering certain flag bits within the packets, by checking the boxes corresponding to the flag bits of the TCP field. The user may choose between urg (urgent), ack (acknowledgement), psh (push), rst (reset), syn (synchronize), fin (finish).</p> <p>Select <i>UDP</i> to use the UDP port number contained in an incoming packet as the forwarding criterion. Selecting UDP requires that you specify a source port mask and/or a destination port mask.</p> <p><i>src port mask</i> - Specify a UDP port mask for the source port in hex form (hex 0x0-0xffff).</p> <p><i>dst port mask</i> - Specify a UDP port mask for the destination port in hex form (hex 0x0-0xffff).</p> <p>Select <i>Protocol ID</i> - Enter a value defining the protocol ID in the packet header to mask. Specify the protocol ID mask in hex form (hex 0x0-0xff).</p> <p><i>Protocol ID Mask</i> - Specify that the rule applies to the IP protocol ID traffic.</p> <p><i>User Define</i> - Specify the Layer 4 part mask</p>
--	---

Click the **Select** button to select an ACL type.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the **Create** button to create a profile.

After clicking the **Show Details** button, the following page will appear:

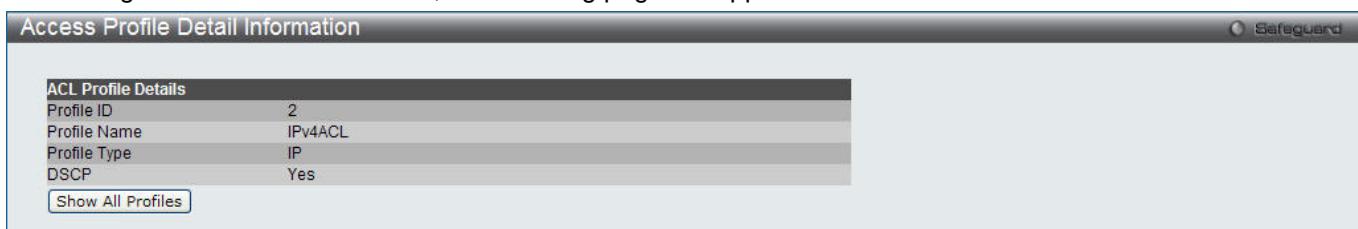

Figure 7-9 Access Profile Detail Information window (IPv4 ACL)

Click the **Show All Profiles** button to navigate back to the **Access Profile List** window.

After clicking the **Add/View Rules** button, the following page will appear:

<a href="#">&lt;&lt;Back</a> <a href="#">Apply</a>				

Figure 7-11 Add Access Rule (IPv4 ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Access ID (1-256)</b>	Type in a unique identifier number for this access. This value can be set from 1 to 256. <b>Auto Assign</b> – Tick the check box will instruct the Switch to automatically assign an Access ID for the rule being created.
<b>Action</b>	Select Permit to specify that the packets that match the access profile are forwarded by

	the Switch, according to any additional rule added (see below). Select Deny to specify that the packets that match the access profile are not forwarded by the Switch and will be filtered. Select Mirror to specify that packets that match the access profile are mirrored to a port defined in the config mirror port command. Port Mirroring must be enabled and a target port must be set.
<b>Priority (0-7)</b>	Tick the corresponding check box if you want to re-write the 802.1p default priority of a packet to the value entered in the Priority field, which meets the criteria specified previously in this command, before forwarding it on to the specified CoS queue. Otherwise, a packet will have its incoming 802.1p user priority re-written to its original value before being forwarded by the Switch. For more information on priority queues, CoS queues and mapping for 802.1p, see the QoS section of this manual.
<b>Replace Priority</b>	Tick this check box to replace the Priority value in the adjacent field.
<b>Replace DSCP (0-63)</b>	Select this option to instruct the Switch to replace the DSCP value (in a packet that meets the selected criteria) with the value entered in the adjacent field. When an ACL rule is added to change both the priority and DSCP of an IPv4 packet, only one of them can be modified due to a chip limitation. Currently the priority is changed when both the priority and DSCP are set to be modified.
<b>Replace ToS Precedence (0-7)</b>	Specify that the IP precedence of the outgoing packet is changed with the new value. If used without an action priority, the packet is sent to the default TC.
<b>Time Range Name</b>	Tick the check box and enter the name of the Time Range settings that has been previously configured in the <b>Time Range Settings</b> window. This will set specific times when this access rule will be implemented on the Switch.
<b>Counter</b>	Here the user can select the counter. By checking the counter, the administrator can see how many times that the rule was hit.
<b>Ports</b>	When a range of ports is to be configured, the Auto Assign check box MUST be ticked in the Access ID field of this window. If not, the user will be presented with an error message and the access rule will not be configured. Ticking the All Ports check box will denote all ports on the Switch.
<b>VLAN Name</b>	Specify the VLAN name to apply to the access rule.
<b>VLAN ID</b>	Specify the VLAN ID to apply to the access rule.

Click the <<Back button to discard the changes made and return to the previous page.

Click the **Apply** button to accept the changes made.

After clicking the **Show Details** button in the **Access Rule List**, the following page will appear:

ACL Rule Details	
Profile ID	2
Access ID	1
Profile Type	IP
Action	Permit
Ports	1:5
DSCP	30

[Show All Rules](#)

Figure 7-12 Access Rule Detail Information (IPv4 ACL)

Click the **Show All Rules** button to navigate back to the Access Rule List.

## Adding an IPv6 ACL Profile

The window shown below is the Add ACL Profile window for IPv6. To use specific filtering masks in this ACL profile, click the packet filtering mask field to highlight it red. This will add more fields to the mask.

After clicking the **Add ACL Profile** button, the following page will appear:

**Add ACL Profile**

Profile ID (1-6)  Profile Name

Select ACL Type

Ethernet ACL  IPv4 ACL  
 IPv6 ACL  Packet Content ACL

You can select the field in the packet to create filtering mask

**IPv6 Class**

IPv6 Class

**IPv6 Flow Label**

IPv6 Flow Label

**TCP**

TCP  
 Source Port Mask (0-FFFF)   
 Destination Port Mask (0-FFFF)

**IPv6 Address**

IPv6 Source Mask   
 IPv6 Destination Mask

[<<Back](#) [Create](#)

Figure 7-13 Add ACL Profile window (IPv6 ACL)

The fields that can be configured are described below:

Parameter	Description
Profile ID (1-6)	Enter a unique identifier number for this profile set. This value can be set from 1 to 6.
Select ACL Type	Select profile based on Ethernet (MAC Address), IPv4 address, IPv6 address, or packet content. This will change the window according to the requirements for the type of profile. <ul style="list-style-type: none"> <li>• Select Ethernet ACL to instruct the Switch to examine the layer 2 part of each packet header.</li> <li>• Select IPv4 ACL to instruct the Switch to examine the IPv4 address in each frame's header.</li> <li>• Select IPv6 ACL to instruct the Switch to examine the IPv6 address in each frame's header.</li> <li>• Select Packet Content to instruct the Switch to examine the packet content in each frame's header.</li> </ul>
IPv6 Class	Ticking this check box will instruct the Switch to examine the <i>class</i> field of the IPv6 header. This class field is a part of the packet header that is similar to the Type of Service (ToS) or Precedence bits field in IPv4.

<b>IPv6 Flow Label</b>	Ticking this check box will instruct the Switch to examine the <i>flow label</i> field of the IPv6 header. This flow label field is used by a source to label sequences of packets such as non-default quality of service or real time service packets.
<b>IPv6 TCP</b>	<i>Source Port Mask</i> – Specify that the rule applies to the range of TCP source ports. <i>Destination Port Mask</i> – Specify the range of the TCP destination port range.
<b>IPv6 UDP</b>	<i>Source Port Mask</i> – Specify the range of the TCP source port range. <i>Destination Port Mask</i> – Specify the range of the TCP destination port mask.
<b>ICMP</b>	Select <i>ICMP</i> to instruct the Switch to examine the Internet Control Message Protocol (ICMP) field in each frame's header.
<b>IPv6 Source Mask</b>	The user may specify an IPv6 address mask for the source IPv6 address by ticking the corresponding check box and entering the IPv6 address mask.
<b>IPv6 Destination Mask</b>	The user may specify an IPv6 address mask for the destination IPv6 address by ticking the corresponding check box and entering the IPv6 address mask.

Click the **Select** button to select an ACL type.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the **Create** button to create a profile.

After clicking the **Show Details** button, the following page will appear:

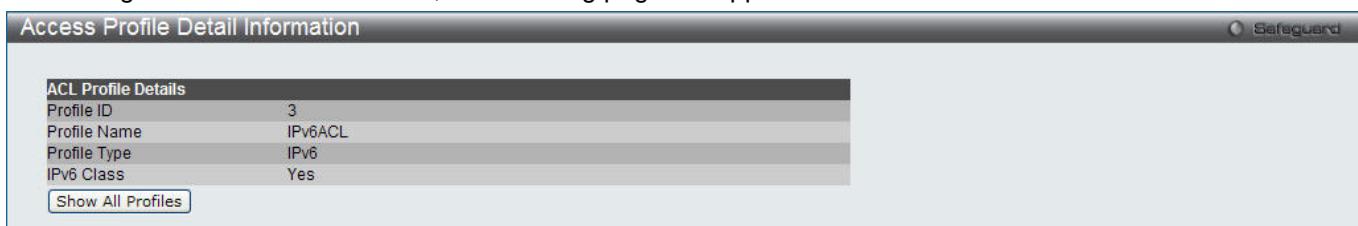

Figure 7-14 Access Profile Detail Information window (IPv6 ACL)

Click the **Show All Profiles** button to navigate back to the **Access Profile List** window.

After clicking the **Add/View Rules** button, the following page will appear:

Figure 7-15 Access Rule List window (IPv6 ACL)

Click the **<<Back** button to return to the previous page.

Click the **Add Rule** button to create a new ACL rule in this profile.

Click the **Show Details** button to view more information about the specific rule created.

Click the **Delete Rules** button to remove the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

After clicking the **Add Rule** button, the following page will appear:

**Profile Information**

Profile ID	3	Profile Name	IPv6ACL
Profile Type	IPv6	IPv6 Class	Yes

**Rule Detail**  
 (Keep the input field blank to specify that the corresponding option does not matter).

Access ID (1-256)	1	<input type="checkbox"/> Auto Assign (e.g.: 0-255)

Counter	Disabled	<input type="checkbox"/>
Mirror Group ID (1-4)		
Ports	(e.g.: 1:1, 1:4-1:6, 1:9)	

**Buttons:** <<Back, Apply

Figure 7-16 Add Access Rule (IPv6 ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Access ID (1-256)</b>	Type in a unique identifier number for this access. This value can be set from 1 to 256. <b>Auto Assign</b> – Tick the check box will instruct the Switch to automatically assign an Access ID for the rule being created.
<b>Action</b>	Select <i>Permit</i> to specify that the packets that match the access profile are forwarded by the Switch, according to any additional rule added (see below). Select <i>Deny</i> to specify that packets that match the access profile are not forwarded by the Switch and will be filtered. Select <i>Mirror</i> to specify that packets that match the access profile are mirrored to a port defined in the config mirror port command. Port Mirroring must be enabled and a target port must be set.
<b>Priority (0-7)</b>	Tick the corresponding check box to re-write the 802.1p default priority of a packet to the value entered in the Priority field, which meets the criteria specified previously in this command, before forwarding it on to the specified CoS queue. Otherwise, a packet will have its incoming 802.1p user priority re-written to its original value before being forwarded by the Switch. For more information on priority queues, CoS queues and mapping for 802.1p, see the QoS section of this manual.
<b>Replace Priority</b>	Tick this check box to replace the Priority value in the adjacent field.
<b>Replace DSCP (0-63)</b>	Select this option to instruct the Switch to replace the DSCP value (in a packet that meets the selected criteria) with the value entered in the adjacent field. When an ACL rule is added to change both the priority and DSCP of an IPv6 packet, only one of them can be modified due to a chip limitation. Currently the priority is changed when both the priority and DSCP are set to be modified.

<b>Replace ToS Precedence (0-7)</b>	Specify that the IP precedence of the outgoing packet is changed with the new value. If used without an action priority, the packet is sent to the default TC.
<b>Time Range Name</b>	Tick the check box and enter the name of the Time Range settings that has been previously configured in the <b>Time Range Settings</b> window. This will set specific times when this access rule will be implemented on the Switch.
<b>Counter</b>	Here the user can select the counter. By checking the counter, the administrator can see how many times that the rule was hit.
<b>Ports</b>	When a range of ports is to be configured, the Auto Assign check box MUST be ticked in the Access ID field of this window. If not, the user will be presented with an error message and the access rule will not be configured. Ticking the All Ports check box will denote all ports on the Switch.
<b>VLAN Name</b>	Specify the VLAN name to apply to the access rule.
<b>VLAN ID</b>	Specify the VLAN ID to apply to the access rule.

Click the <<Back button to discard the changes made and return to the previous page.

Click the **Apply** button to accept the changes made.

After clicking the **Show Details** button in the **Access Rule List**, the following page will appear:

The screenshot shows the 'Access Rule Detail Information' window. At the top, there is a 'Safeguard' button. Below it, a table titled 'ACL Rule Details' displays the following configuration:

ACL Rule Details	
Profile ID	3
Access ID	1
Profile Type	IPv6
Action	Permit
Ports	1:7
IPv6 Class	30

At the bottom left of the table, there is a 'Show All Rules' button.

**Figure 7-17 Access Rule Detail Information (IPv6 ACL)**

Click the **Show All Rules** button to navigate back to the Access Rule List.

## Adding a Packet Content ACL Profile

The window shown below is the Add ACL Profile window for Packet Content: To use specific filtering masks in this ACL profile, click the packet filtering mask field to highlight it red. This will add more filed to the mask.

After clicking the **Add ACL Profile** button, the following page will appear:

The screenshot shows the 'Add ACL Profile' interface for a 'Packet Content ACL'. At the top, there are fields for 'Profile ID (1-6)' (set to 4) and 'Profile Name' (set to PCACL). Below these, under 'Select ACL Type', 'Ethernet ACL' and 'IPv6 ACL' are unselected, while 'IPv4 ACL' and 'Packet Content ACL' are selected. A note says 'You can select the field in the packet to create filtering mask'. The main area is titled 'Packet Content' and contains a table for defining up to four offset\_chunks. Each row has a checkbox for selecting a chunk (e.g., 'Chunk 1(0-31)'), a corresponding input field for its mask (e.g., 'mask 00000000'), and a 'Select' button. At the bottom are 'Back' and 'Create' buttons.

Figure 7-18 Add ACL Profile (Packet Content ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID (1-6)</b>	Enter a unique identifier number for this profile set. This value can be set from 1 to 6.
<b>Select ACL Type</b>	Select profile based on Ethernet (MAC Address), IPv4 address, IPv6 address, or packet content. This will change the window according to the requirements for the type of profile. Select Ethernet ACL to instruct the Switch to examine the layer 2 part of each packet header. Select IPv4 ACL to instruct the Switch to examine the IPv4 address in each frame's header. Select IPv6 ACL to instruct the Switch to examine the IPv6 address in each frame's header. Select Packet Content to instruct the Switch to examine the packet content in each frame's header.
<b>Packet Content</b>	Allows users to examine up to 4 specified offset_chunks within a packet at one time and specifies the frame content offset and mask. There are 4 chunk offsets and masks that can be configured. A chunk mask presents 4 bytes. 4 offset_chunks can be selected from a possible 32 predefined offset_chunks as described below: offset_chunk_1, offset_chunk_2, offset_chunk_3, offset_chunk_4.

chunk0	chunk1	chunk2	.....	chunk29	chunk30	chunk31
--------	--------	--------	-------	---------	---------	---------

	B126, B127, B0, B1	B2, B3, B4, B5	B6, B7, B8, B9	.....	B114, B115, B116, B117	B118, B119, B120, B121	B122, B123, B124, B125	
--	-----------------------------	-------------------------	-------------------------	-------	---------------------------------	---------------------------------	---------------------------------	--

Example:  
offset\_chunk\_1 0 0xffffffff will match packet byte offset 126,127,0,1  
offset\_chunk\_1 0 0x0000ffff will match packet byte offset,0,1

**NOTE:** Only one packet\_content\_mask profile can be created.

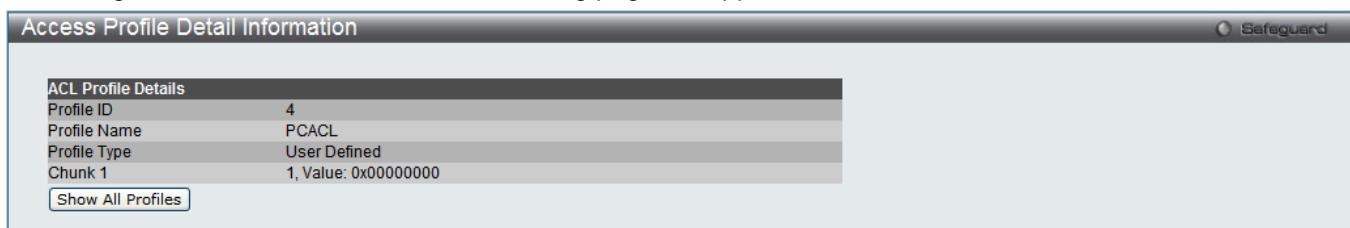

With this advanced unique Packet Content Mask (also known as Packet Content Access Control List - ACL), the D-Link xStack® switch family can effectively mitigate some network attacks like the common ARP Spoofing attack that is wide spread today. This is why the Packet Content ACL is able to inspect any specified content of a packet in different protocol layers.

Click the **Select** button to select an ACL type.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the **Create** button to create a profile.

After clicking the **Show Details** button, the following page will appear:

The screenshot shows the 'Access Profile Detail Information' window. It displays the following details for profile ID 4, named 'PCACL', which is a 'User Defined' profile:

- Profile ID: 4
- Profile Name: PCACL
- Profile Type: User Defined
- Chunk 1: 1, Value: 0x00000000

At the bottom left is a 'Show All Profiles' button.

Figure 7-19 Access Profile Detail Information (Packet Content ACL)

Click the **Show All Profiles** button to navigate back to the **Access Profile List** window.

**NOTE:** Address Resolution Protocol (ARP) is the standard for finding a host's hardware address (MAC address). However, ARP is vulnerable as it can be easily spoofed and utilized to attack a LAN (i.e. an ARP spoofing attack). For a more detailed explanation on how ARP protocol works and how to employ D-Link's unique Packet Content ACL to prevent ARP spoofing attack, please see Appendix E at the end of this manual.

After clicking the **Add/View Rules** button, the following page will appear:

The screenshot shows the 'Access Rule List' window. It lists one rule for profile ID 4:

Profile ID	Access ID	Profile Type	Action
4	1	User Defined	Permit

Buttons at the top include '<<Back', 'Add Rule', and 'Available HW Entries: 254'. At the bottom are 'Show Details', 'Delete Rules', and navigation buttons '1/1', '1', and 'Go'.

Figure 7-20 Access Rule List (Packet Content ACL)

Click the **<<Back** button to return to the previous page.

Click the **Add Rule** button to create a new ACL rule in this profile.

Click the **Show Details** button to view more information about the specific rule created.

Click the **Delete Rules** button to remove the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

After clicking the **Add Rule** button, the following page will appear:

**Profile Information**

Profile ID	4	Profile Name	PCACL
Profile Type	User Defined	Chunk 1	1, Value: 0x00000000

Figure 7-21 Add Access Rule (Packet Content ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Access ID (1-256)</b>	Type in a unique identifier number for this access. This value can be set from 1 to 256. <b>Auto Assign</b> – Tick the check box will instruct the Switch to automatically assign an Access ID for the rule being created.
<b>Action</b>	Select <i>Permit</i> to specify that the packets that match the access profile are forwarded by the Switch, according to any additional rule added (see below). Select <i>Deny</i> to specify that the packets that match the access profile are not forwarded by the Switch and will be filtered. Select <i>Mirror</i> to specify that packets that match the access profile are mirrored to a port defined in the config mirror port command. Port Mirroring must be enabled and a target port must be set.
<b>Priority (0-7)</b>	Tick the corresponding check box if you want to re-write the 802.1p default priority of a packet to the value entered in the Priority field, which meets the criteria specified previously in this command, before forwarding it on to the specified CoS queue. Otherwise, a packet will have its incoming 802.1p user priority re-written to its original value before being forwarded by the Switch. For more information on priority queues, CoS queues and mapping for 802.1p, see the QoS section of this manual.

<b>Replace Priority</b>	Tick this check box to replace the Priority value in the adjacent field.
<b>Replace DSCP (0-63)</b>	Select this option to instruct the Switch to replace the DSCP value (in a packet that meets the selected criteria) with the value entered in the adjacent field. When an ACL rule is added to change both the priority and DSCP of an IPv4 packet, only one of them can be modified due to a chip limitation. Currently the priority is changed when both the priority and DSCP are set to be modified.
<b>Replace ToS Precedence (0-7)</b>	Specify that the IP precedence of the outgoing packet is changed with the new value. If used without an action priority, the packet is sent to the default TC.
<b>Time Range Name</b>	Tick the check box and enter the name of the Time Range settings that has been previously configured in the <b>Time Range Settings</b> window. This will set specific times when this access rule will be implemented on the Switch.
<b>Counter</b>	Here the user can select the counter. By checking the counter, the administrator can see how many times that the rule was hit.
<b>Ports</b>	When a range of ports is to be configured, the Auto Assign check box MUST be ticked in the Access ID field of this window. If not, the user will be presented with an error message and the access rule will not be configured. Ticking the All Ports check box will denote all ports on the Switch.
<b>VLAN Name</b>	Specify the VLAN name to apply to the access rule.
<b>VLAN ID</b>	Specify the VLAN ID to apply to the access rule.

Click the <<Back button to discard the changes made and return to the previous page.

Click the **Apply** button to accept the changes made.

After clicking the **Show Details** button in the **Access Rule List**, the following page will appear:

ACL Rule Details	
Profile ID	4
Access ID	1
Profile Type	User Defined
Action	Permit
Ports	1:4
Chunk 1	1, Value: 0x00000000, Mask: 0x00000000

**Show All Rules**

Figure 7-22 Access Rule Detail Information (Packet Content ACL)

Click the **Show All Rules** button to navigate back to the Access Rule List.

## CPU Access Profile List

Due to a chipset limitation and needed extra switch security, the Switch incorporates CPU Interface filtering. This added feature increases the running security of the Switch by enabling the user to create a list of access rules for packets destined for the Switch's CPU interface. Employed similarly to the Access Profile feature previously mentioned, CPU interface filtering examines Ethernet, IP and Packet Content Mask packet headers destined for the CPU and will either forward them or filter them, based on the user's implementation. As an added feature for the CPU Filtering, the Switch allows the CPU filtering mechanism to be enabled or disabled globally, permitting the user to create various lists of rules without immediately enabling them.

**NOTE:** CPU Interface Filtering is used to control traffic access to the switch directly such as protocols transition or management access. A CPU interface filtering rule won't impact normal L2/3 traffic forwarding. However, an improper CPU interface filtering rule may cause the network to become unstable.

To view CPU Access Profile List window, click **ACL > CPU Access Profile List** as shown below:

Creating an access profile for the CPU is divided into two basic parts. The first is to specify which part or parts of a frame the Switch will examine, such as the MAC source address or the IP destination address. The second part is entering the criteria the Switch will use to determine what to do with the frame. The entire process is described below.

Users may globally enable or disable the CPU Interface Filtering State mechanism by using the radio buttons to change the running state. Choose Enabled to enable CPU packets to be scrutinized by the Switch and Disabled to disallow this scrutiny.

Profile ID	Profile Type	Action
1	Ethernet	Show Details Add/View Rules Delete
2	IP	Show Details Add/View Rules Delete
3	IPv6	Show Details Add/View Rules Delete
4	User Defined	Show Details Add/View Rules Delete

**Figure 7-23 CPU Access Profile List window**

The fields that can be configured are described below:

Parameter	Description
<b>CPU Interface Filtering State</b>	Here the user can enable or disable the CPU interface filtering state.

Click the **Apply** button to accept the changes made.

Click the **Add CPU ACL Profile** button to add an entry to the **CPU ACL Profile List**.

Click the **Delete All** button to remove all access profiles from this table.

Click the **Show Details** button to display the information of the specific profile ID entry.

Click the **Add/View Rules** button to view or add CPU ACL rules within the specified profile ID.

Click the **Delete** button to remove the specific entry.

There are four **Add CPU ACL Profile** windows;

- one for Ethernet (or MAC address-based) profile configuration,
- one for IPv6 address-based profile configuration,
- one for IPv4 address-based profile configuration, and
- one for packet content profile configuration.

## Adding a CPU Ethernet ACL Profile

The window shown below is the Add CPU ACL Profile window for Ethernet. To use specific filtering masks in this ACL profile, click the packet filtering mask field to highlight it red. This will add more filed to the mask.

After clicking the **Add CPU ACL Profile** button, the following page will appear:

**Add CPU ACL Profile**

Profile ID (1-5)

Select ACL Type  
 Ethernet ACL     IPv4 ACL  
 IPv6 ACL     Packet Content ACL

You can select the field in the packet to create filtering mask

Figure 7-24 Add CPU ACL Profile (Ethernet ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID (1-5)</b>	Enter a unique identifier number for this profile set. This value can be set from 1 to 5.
<b>Select ACL Type</b>	Select profile based on Ethernet (MAC Address), IPv4 address, IPv6 address, or packet content mask. This will change the window according to the requirements for the type of profile.  Select Ethernet to instruct the Switch to examine the layer 2 part of each packet header. Select IPv4 to instruct the Switch to examine the IP address in each frame's header. Select IPv6 to instruct the Switch to examine the IP address in each frame's header. Select Packet Content Mask to specify a mask to hide the content of the packet header.
<b>Source MAC Mask</b>	Enter a MAC address mask for the source MAC address.
<b>Destination MAC Mask</b>	Enter a MAC address mask for the destination MAC address.
<b>802.1Q VLAN</b>	Selecting this option instructs the Switch to examine the VLAN identifier of each packet header and use this as the full or partial criterion for forwarding.
<b>802.1p</b>	Selecting this option instructs the Switch to specify that the access profile will apply only to packets with this 802.1p priority value.
<b>Ethernet Type</b>	Selecting this option instructs the Switch to examine the Ethernet type value in each frame's header.

Click the **Select** button to select a CPU ACL type.

Click the **Create** button to create a profile.

Click the **<<Back** button to discard the changes made and return to the previous page.

After clicking the **Show Details** button, the following page will appear:

The screenshot shows the 'CPU Access Profile Detail Information' window. At the top, there's a 'Safeguard' button. Below it, the title 'CPU ACL Profile Details' is displayed. Underneath, there are three entries: 'Profile ID' set to '1', 'Profile Type' set to 'Ethernet', and 'VLAN' set to '0FFF'. At the bottom left is a 'Show All Profiles' button.

**Figure 7-25 CPU Access Profile Detail Information (Ethernet ACL)**

Click the **Show All Profiles** button to navigate back to the **CPU ACL Profile List** window.

After clicking the **Add/View Rules** button, the following page will appear:

The screenshot shows the 'CPU Access Rule List' window. At the top, there are buttons for '<<Back' and 'Add Rule', and a message 'Unused Rule Entries: 99'. Below is a table with one row of data:

Profile ID	Access ID	Profile Type	Action
1	1	Ethernet	Permit

At the bottom right are buttons for 'Show Details', 'Delete Rules', '1/1', '1', and 'Go'.

**Figure 7-26 CPU Access Rule List (Ethernet ACL)**

Click the **Add Rule** button to create a new CPU ACL rule in this profile.

Click the **<<Back** button to return to the previous page.

Click the **Show Details** button to view more information about the specific rule created.

Click the **Delete Rules** button to remove the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

After clicking the **Add Rule** button, the following page will appear:

**Profile Information**

Profile ID	1	Profile Type	Ethernet
VLAN	0xFFFF

VLAN

**IPv4 DSCP**

DSCP

**IPv4 Address**

Source IP Mask

Destination IP Mask

<<Back      Create

Figure 7-29 Add CPU ACL Profile (IPv4 ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID (1-5)</b>	Enter a unique identifier number for this profile set. This value can be set from 1 to 5.
<b>Select ACL Type</b>	Select profile based on Ethernet (MAC Address), IPv4 address, IPv6 address, or packet content mask. This will change the menu according to the requirements for the type of profile. Select Ethernet to instruct the Switch to examine the layer 2 part of each packet header.

	Select IPv4 to instruct the Switch to examine the IP address in each frame's header. Select IPv6 to instruct the Switch to examine the IP address in each frame's header. Select Packet Content Mask to specify a mask to hide the content of the packet header.
<b>802.1Q VLAN</b>	Selecting this option instructs the Switch to examine the VLAN part of each packet header and use this as the, or part of the criterion for forwarding.
<b>IPv4 DSCP</b>	Selecting this option instructs the Switch to examine the DiffServ Code part of each packet header and use this as the, or part of the criterion for forwarding.
<b>Source IP Mask</b>	Enter an IP address mask for the source IP address, e.g. 255.255.255.255.
<b>Destination IP Mask</b>	Enter an IP address mask for the destination IP address, e.g. 255.255.255.255.
<b>Protocol</b>	<p>Selecting this option instructs the Switch to examine the protocol type value in each frame's header. You must then specify what protocol(s) to include according to the following guidelines:</p> <p>Select <i>/ICMP</i> to instruct the Switch to examine the Internet Control Message Protocol (ICMP) field in each frame's header.</p> <p>Select <i>Type</i> to further specify that the access profile will apply an ICMP type value, or specify <i>Code</i> to further specify that the access profile will apply an ICMP code value.</p> <p>Select <i>/IGMP</i> to instruct the Switch to examine the Internet Group Management Protocol (IGMP) field in each frame's header.</p> <p>Select <i>Type</i> to further specify that the access profile will apply an IGMP type value.</p> <p>Select <i>TCP</i> to use the TCP port number contained in an incoming packet as the forwarding criterion. Selecting TCP requires a source port mask and/or a destination port mask is to be specified. The user may also identify which flag bits to filter. Flag bits are parts of a packet that determine what to do with the packet. The user may filter packets by filtering certain flag bits within the packets, by checking the boxes corresponding to the flag bits of the TCP field. The user may choose between urg (urgent), ack (acknowledgement), psh (push), rst (reset), syn (synchronize), fin (finish).</p> <p><i>src port mask</i> - Specify a TCP port mask for the source port in hex form (hex 0x0-0xffff), which you wish to filter.</p> <p><i>dst port mask</i> - Specify a TCP port mask for the destination port in hex form (hex 0x0-0xffff) which you wish to filter.</p> <p>Select <i>UDP</i> to use the UDP port number contained in an incoming packet as the forwarding criterion. Selecting UDP requires that you specify a source port mask and/or a destination port mask.</p> <p><i>src port mask</i> - Specify a UDP port mask for the source port in hex form (hex 0x0-0xffff).</p> <p><i>dst port mask</i> - Specify a UDP port mask for the destination port in hex form (hex 0x0-0xffff).</p> <p>Select <i>Protocol ID</i> - Enter a value defining the protocol ID in the packet header to mask. Specify the protocol ID mask in hex form (hex 0x0-0xff).</p> <p><i>Protocol ID Mask</i> – Specify that the rule applies to the IP Protocol ID Traffic.</p> <p><i>User Define</i> – Specify the L4 part mask.</p>

Click the **Select** button to select a CPU ACL type.

Click the **Create** button to create a profile.

Click the **<<Back** button to discard the changes made and return to the previous page.

After clicking the **Show Details** button, the following page will appear:

The screenshot shows the "CPU Access Profile Detail Information" window. At the top, there is a "Safeguard" button. Below it, the title "CPU ACL Profile Details" is displayed. A table contains the following information:

Profile ID	2
Profile Type	IP
DSCP	Yes

At the bottom left of the window is a "Show All Profiles" button.

Figure 7-30 CPU Access Profile Detail Information (IPv4 ACL)

Click the **Show All Profiles** button to navigate back to the **CPU ACL Profile List** window.

After clicking the **Add/View Rules** button, the following page will appear:

The screenshot shows the "CPU Access Rule List" window. At the top, there is a "Safeguard" button. Below it, the title "CPU Access Rule List" is displayed. A toolbar includes "<<Back", "Add Rule", and "Unused Rule Entries: 99". A table lists the rule entries:

Profile ID	Access ID	Profile Type	Action
2	1	IP	Permit

Buttons for "Show Details" and "Delete Rules" are located to the right of the table. At the bottom right are page navigation buttons: "1/1", "1", an empty input field, and a "Go" button.

Figure 7-31 CPU Access Rule List (IPv4 ACL)

Click the **Add Rule** button to create a new CPU ACL rule in this profile.

Click the **<<Back** button to return to the previous page.

Click the **Show Details** button to view more information about the specific rule created.

Click the **Delete Rules** button to remove the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

After clicking the **Add Rule** button, the following page will appear:

**Profile Information**

Profile ID	2	Profile Type	IP
DSCP	Yes

**Rule Detail**  
(Keep the input field blank to specify that the corresponding option does not matter).

Access ID (1-100)	<input type="text" value="1"/> <input type="checkbox"/> Auto Assign
DSCP	<input type="text"/> (e.g.: 0-63)

**Rule Action**

Action	Permit <input type="button" value="▼"/>
Time Range Name	<input type="text"/> <input type="checkbox"/>
Ports	<input type="text"/> (e.g.: 1, 4-6, 9)

[\*\*<<Back\*\*](#) [\*\*Apply\*\*](#)

Figure 7-32 Add CPU Access Rule (IPv4 ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Access ID (1-100)</b>	Type in a unique identifier number for this access. This value can be set from 1 to 100. <b>Auto Assign</b> – Tick the check box will instruct the Switch to automatically assign an Access ID for the rule being created.
<b>Action</b>	Select <b>Permit</b> to specify that the packets that match the access profile are forwarded by the Switch, according to any additional rule added (see below). Select <b>Deny</b> to specify that the packets that match the access profile are not forwarded by the Switch and will be filtered.
<b>Time Range Name</b>	Tick the check box and enter the name of the Time Range settings that has been previously configured in the <b>Time Range Settings</b> window. This will set specific times when this access rule will be implemented on the Switch.
<b>Ports</b>	Ticking the All Ports check box will denote all ports on the Switch.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

After clicking the **Show Details** button in the **CPU Access Rule List**, the following page will appear:

**CPU ACL Rule Details**

[\*\*<<Back\*\*](#) [\*\*Apply\*\*](#)

**Figure 7-42 Add CPU Access Rule (Packet Content ACL)**

The fields that can be configured are described below:

Parameter	Description
<b>Access ID (1-100)</b>	Type in a unique identifier number for this access. This value can be set from 1 to 100. <b>Auto Assign</b> – Tick the check box will instruct the Switch to automatically assign an Access ID for the rule being created.
<b>Action</b>	Select <i>Permit</i> to specify that the packets that match the access profile are forwarded by the Switch, according to any additional rule added (see below). Select <i>Deny</i> to specify that the packets that match the access profile are not forwarded by the Switch and will be filtered.
<b>Offset</b>	This field will instruct the Switch to mask the packet header beginning with the offset value specified: Offset 0-15 - Enter a value in hex form to mask the packet from the beginning of the packet to the 15th byte. Offset 16-31 - Enter a value in hex form to mask the packet from byte 16 to byte 31. Offset 32-47 - Enter a value in hex form to mask the packet from byte 32 to byte 47. Offset 48-63 - Enter a value in hex form to mask the packet from byte 48 to byte 63. Offset 64-79 - Enter a value in hex form to mask the packet from byte 64 to byte 79.
<b>Time Range Name</b>	Tick the check box and enter the name of the Time Range settings that has been previously configured in the <b>Time Range Settings</b> window. This will set specific times when this access rule will be implemented on the Switch.
<b>Ports</b>	Ticking the All Ports check box will denote all ports on the Switch.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

After clicking the **Show Details** button in the **CPU Access Rule List**, the following page will appear:

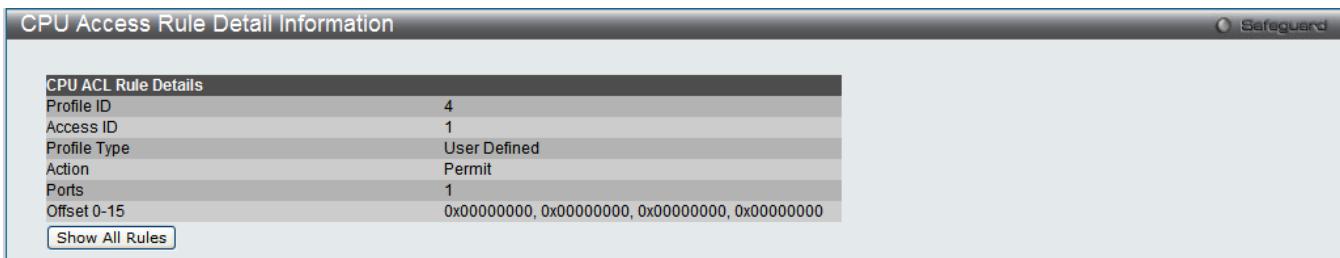

Figure 7-43 CPU Access Rule Detail Information (Packet Content ACL)

Click the **Show All Rules** button to navigate back to the CPU Access Rule List.

## ACL Finder

The ACL rule finder helps you to identify any rules that have been assigned to a specific port and edit existing rules quickly.

To view this window, click **ACL > ACL Finder** as shown below:

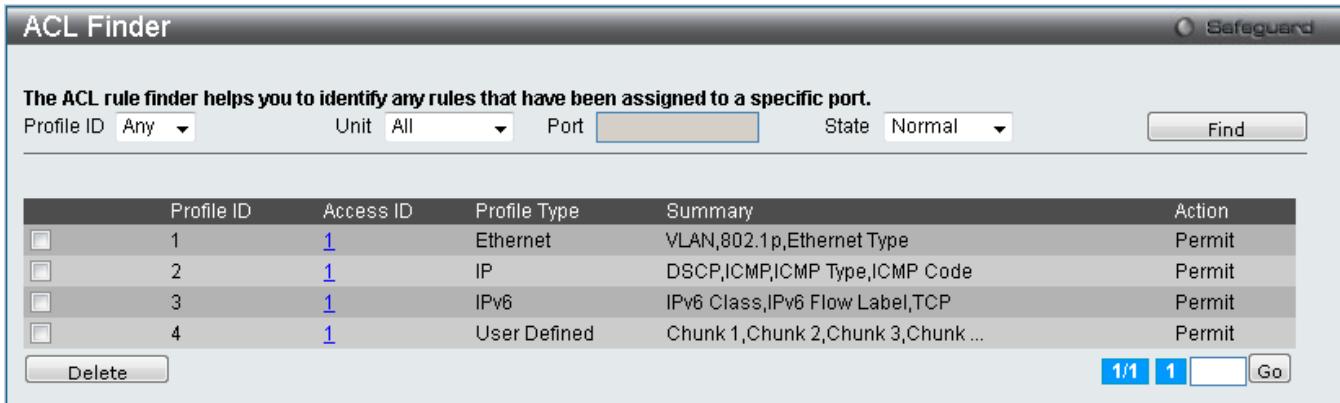

Figure 7-44 ACL Finder window

The fields that can be configured are described below:

Parameter	Description
Profile ID	Use the drop-down menu to select the Profile ID for the ACL rule finder to identify the rule.
Unit	Select the unit you wish to configure.
Port	Enter the port number for the ACL rule finder to identify the rule.
State	Use the drop-down menu to select the state. <i>Normal</i> - Allow the user to find normal ACL rules. <i>CPU</i> - Allow the user to find CPU ACL rules. <i>Egress</i> – Allow the user to find Egress ACL rules.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Delete** button to remove the specific entry selected.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## ACL Flow Meter

Before configuring the ACL Flow Meter, here is a list of acronyms and terms users will need to know.

- **trTCM** – Two Rate Three Color Marker. This, along with the srTCM, are two methods available on the switch for metering and marking packet flow. The trTCM meters and IP flow and marks it as a color based on the flow's surpassing of two rates, the CIR and the PIR.
- **CIR** – Committed Information Rate. Common to both the trTCM and the srTCM, the CIR is measured in bytes of IP packets. IP packet bytes are measured by taking the size of the IP header but not the link specific headers. For the trTCM, the packet flow is marked green if it doesn't exceed the CIR and yellow if it does. The configured rate of the CIR must not exceed that of the PIR. The CIR can also be configured for unexpected packet bursts using the CBS and PBS fields.
- **CBS** – Committed Burst Size. Measured in bytes, the CBS is associated with the CIR and is used to identify packets that exceed the normal boundaries of packet size. The CBS should be configured to accept the biggest IP packet that is expected in the IP flow.
- **PIR** – Peak Information Rate. This rate is measured in bytes of IP packets. IP packet bytes are measured by taking the size of the IP header but not the link specific headers. If the packet flow exceeds the PIR, that packet flow is marked red. The PIR must be configured to be equal or more than that of the CIR.
- **PBS** – Peak Burst Size. Measured in bytes, the PBS is associated with the PIR and is used to identify packets that exceed the normal boundaries of packet size. The PBS should be configured to accept the biggest IP packet that is expected in the IP flow.
- **srTCM** – Single Rate Three Color Marker. This, along with the trTCM, are two methods available on the switch for metering and marking packet flow. The srTCM marks its IP packet flow based on the configured CBS and EBS. A packet flow that does not reach the CBS is marked green, if it exceeds the CBS but not the EBS its marked yellow, and if it exceeds the EBS its marked red.
- **CBS** – Committed Burst Size. Measured in bytes, the CBS is associated with the CIR and is used to identify packets that exceed the normal boundaries of packet size. The CBS should be configured to accept the biggest IP packet that is expected in the IP flow.
- **EBS** – Excess Burst Size. Measured in bytes, the EBS is associated with the CIR and is used to identify packets that exceed the boundaries of the CBS packet size. The EBS is to be configured for an equal or larger rate than the CBS.
- **DSCP** – Differentiated Services Code Point. The part of the packet header where the color will be added. Users may change the DSCP field of incoming packets.

The ACL Flow Meter function will allow users to color code IP packet flows based on the rate of incoming packets. Users have two types of Flow metering to choose from, trTCM and srTCM, as explained previously. When a packet flow is placed in a color code, the user can choose what to do with packets that have exceeded that color-coded rate.

- **Green** – When an IP flow is in the green mode, its configurable parameters can be set in the Conform field, where the packets can have their DSCP field changed. This is an acceptable flow rate for the ACL Flow Meter function.
- **Yellow** – When an IP flow is in the yellow mode, its configurable parameters can be set in the Exceed field. Users may choose to either Permit or Drop exceeded packets. Users may also choose to change the DSCP field of the packets.
- **Red** – When an IP flow is in the red mode, its configurable parameters can be set in the Violate field. Users may choose to either Permit or Drop exceeded packets. Users may also choose to change the DSCP field of the packets.

Users may also choose to count exceeded packets by clicking the Counter check box. If the counter is enabled, the counter setting in the access profile will be disabled. Users may only enable two counters for one flow meter at any given time.

To view this window, click **ACL > ACL Flow Meter**, as shown below:

Profile ID	Access ID	Mode	Modify	View	Delete
1	1	Meter			

1/1 1 Go

Figure 7-45 ACL Flow Meter

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID</b>	Enter the Profile ID for the flow meter.
<b>Profile Name</b>	Enter the Profile Name for the flow meter.
<b>Access ID (1-256)</b>	Enter the Access ID for the flow meter.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Add** button to add a new entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Delete All** button to remove all the entries listed.

Click the **Modify** button to re-configure the specific entry.

Click the **View** button to display the information of the specific entry.

Click the **Delete** button to remove the specific entry.

After clicking the **Add** or **Modify** button, the following page will appear:

Figure 7-46 ACL Flow meter Configuration window

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID</b>	Here the user can enter the Profile ID for the flow meter.
<b>Profile Name</b>	Here the user can enter the Profile Name for the flow meter.
<b>Access ID</b>	Here the user can enter the Access ID for the flow meter.
<b>Mode</b>	<p><b>Rate</b> – Specify the rate for single rate two color mode.</p> <p><b>Rate</b> – Specify the committed bandwidth in Kbps for the flow.</p> <p><b>Burst Size</b> – Specify the burst size for the single rate two color mode. The unit is in kilobyte.</p> <p><b>Rate Exceeded</b> – Specify the action for packets that exceed the committed rate in single rate two color mode. The action can be specified as one of the following:</p> <ul style="list-style-type: none"> <li><b>Drop Packet</b> – Drop the packet immediately.</li> <li><b>Remark DSCP</b> – Mark the packet with a specified DSCP. The packet is set to drop for packets with a high precedence.</li> </ul> <p><b>trTCM</b> – Specify the “two-rate three-color mode.”</p> <p><b>CIR</b> – Specify the Committed information Rate. The unit is Kbps. CIR should always be equal or less than PIR.</p> <p><b>PIR</b> – Specify the Peak information Rate. The unit is Kbps. PIR should always be equal to or greater than CIR.</p> <p><b>CBS</b> – Specify the Committed Burst Size. The unit is in kilobyte.</p> <p><b>PBS</b> – Specify the Peak Burst Size. The unit is in kilobyte.</p> <p><b>srTCM</b> – Specify the “single-rate three-color mode”.</p>

	<p><b>CIR</b> – Specify the Committed Information Rate. The unit is in kilobyte.</p> <p><b>CBS</b> – Specify the Committed Burst Size. The unit is in kilobyte.</p> <p><b>EBS</b> – Specify the Excess Burst Size. The unit is in kilobyte.</p>
<b>Action</b>	<p><b>Conform</b> – This field denotes the green packet flow. Green packet flows may have their <i>DSCP</i> field rewritten to a value stated in this field. Users may also choose to count green packets by using counter parameter.</p> <p><b>Replace DSCP</b> – Packets that are in the green flow may have their DSCP field rewritten using this parameter and entering the DSCP value to replace.</p> <p><b>Counter</b> – Use this parameter to enable or disable the packet counter for the specified ACL entry in the green flow.</p> <p><b>Exceed</b> – This field denotes the yellow packet flow. Yellow packet flows may have excess packets permitted through or dropped. Users may replace the DSCP field of these packets by checking its radio button and entering a new DSCP value in the allotted field.</p> <p><b>Counter</b> – Use this parameter to enable or disable the packet counter for the specified ACL entry in the yellow flow.</p> <p><b>Violate</b> – This field denotes the red packet flow. Red packet flows may have excess packets permitted through or dropped. Users may replace the DSCP field of these packets by checking its radio button and entering a new DSCP value in the allotted field.</p> <p><b>Counter</b> – Use this parameter to enable or disable the packet counter for the specified ACL entry in the red flow.</p>

## Egress Access Profile List

Egress ACL performs per-flow processing of packets when they egress the Switch. The Switch supports three Profile Types, Ethernet ACL, IPv4 ACL, and IPv6 ACL.

To view this window, click **ACL > Egress Access Profile List** as shown below:

Egress Access Profile List			
		Total User Set Rule Entries / Total Used HW Entries / Total Available HW Entries: 0 / 0 / 512	
Profile ID	Profile Name	Profile Type	
1	EtherACL	Ethernet	<a href="#">Show Details</a> <a href="#">Add/View Rules</a> <a href="#">Delete</a>
2	IPv4ACL	IP	<a href="#">Show Details</a> <a href="#">Add/View Rules</a> <a href="#">Delete</a>
3	IPv6ACL	IPv6	<a href="#">Show Details</a> <a href="#">Add/View Rules</a> <a href="#">Delete</a>

1/1 1 Go

Figure 7-48 Egress Access Profile List window

## Adding an Ethernet ACL Profile

The window shown below is the Add Egress ACL Profile window for Ethernet. To use specific filtering masks in this egress ACL profile, click the packet filtering mask field to highlight it red. This will add more fields to the mask.

After clicking the **Add Egress ACL** button, the following page will appear:

Add Egress ACL Profile			
Profile ID (1-4)	1	Profile Name	EtherACL
Select ACL Type	<input checked="" type="radio"/> Ethernet ACL <input type="radio"/> IPv4 ACL <input type="radio"/> IPv6 ACL	Tagged	<a href="#">Select</a>
You can select the field in the packet to create filtering mask

<a href="#">&lt;&lt; Back</a>		<a href="#">Create</a>	

Figure 7-49 Add Egress ACL Profile window (Ethernet ACL)

The fields that can be configured are described below:

Parameter	Description
Profile ID (1-4)	Enter a unique identifier number for this profile set. This value can be set from 1 to 4.
Profile Name	Enter a profile name for the profile created.
Select ACL Type	Select profile based on Ethernet (MAC Address), IPv4 address, or IPv6 address. This will change the window according to the requirements for the type of profile. Select Ethernet ACL to instruct the Switch to examine the layer 2 part of each packet header. Select IPv4 ACL to instruct the Switch to examine the IPv4 address in each frame's

	header. Select IPv6 ACL to instruct the Switch to examine the IPv6 address in each frame's header.
<b>Source MAC Mask</b>	Enter a MAC address mask for the source MAC address.
<b>Destination MAC Mask</b>	Enter a MAC address mask for the destination MAC address.
<b>802.1Q VLAN</b>	Selecting this option instructs the Switch to examine the 802.1Q VLAN identifier of each packet header and use this as the full or partial criterion for forwarding.
<b>802.1p</b>	Selecting this option instructs the Switch to examine the 802.1p priority value of each packet header and use this as the, or part of the criterion for forwarding.
<b>Ethernet Type</b>	Selecting this option instructs the Switch to examine the Ethernet type value in each frame's header.

Click the **Select** button to select an ACL type.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the **Create** button to create a profile.

After clicking the **Show Details** button, the following page will appear:

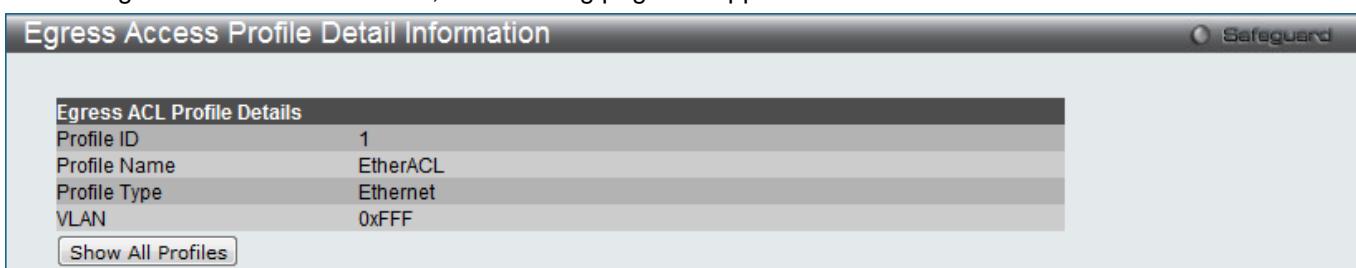

Figure 7-50 Egress Access Profile Detail Information window (Ethernet ACL)

Click the **Show All Profiles** button to navigate back to the **Egress Access Profile List** window.

After clicking the **Add/View Rules** button, the following page will appear:

Figure 7-51 Egress Access Rule List window (Ethernet ACL)

Click the **<<Back** button to return to the previous page.

Click the **Add Rule** button to create a new ACL rule in this profile.

Click the **Show Details** button to view more information about the specific rule created.

Click the **Delete Rules** button to remove the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

After clicking the **Add Rule** button, the following page will appear:

**Profile Information**

Profile ID	1	Profile Name	EtherACL
Profile Type	Ethernet	VLAN	0xFFFF

---

**Rule Detail**  
(Keep the input field blank to specify that the corresponding option does not matter).

Access ID (1-128)	1 <input checked="" type="checkbox"/> Auto Assign
VLAN Name	<input type="text"/>
VLAN ID	<input type="text"/>
VLAN Mask (0-FFF)	<input type="text"/> <input type="checkbox"/>
<b>Rule Action</b>	
Action	Permit <input type="button" value="▼"/>
Priority (0-7)	<input type="checkbox"/> <input type="checkbox"/>
Replace DSCP (0-63)	<input type="checkbox"/> <input type="checkbox"/>
Time Range Name	<input type="text"/> <input type="checkbox"/>
Counter	Disabled <input type="button" value="▼"/>
VLAN Name <input type="button" value="▼"/>	(Max: 32 characters) <input type="text"/> <input type="button" value="&lt;&lt;Back"/> <input type="button" value="Apply"/>

Figure 7-52 Add Egress Access Rule window (Ethernet ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Access ID (1-128)</b>	Type in a unique identifier number for this access. This value can be set from 1 to 128. <b>Auto Assign</b> – Tick the check box will instruct the Switch to automatically assign an Access ID for the rule being created.
<b>Ethernet Type</b>	Specify the Ethernet type.
<b>Action</b>	Select <i>Permit</i> to specify that the packets that match the access profile are forwarded by the Switch, according to any additional rule added (see below). Select <i>Deny</i> to specify that the packets that match the access profile are not forwarded by the Switch and will be filtered.
<b>Priority (0-7)</b>	Tick the corresponding check box if you want to re-write the 802.1p default priority of a packet to the value entered in the Priority field, which meets the criteria specified previously in this command, before forwarding it on to the specified CoS queue. Otherwise, a packet will have its incoming 802.1p user priority re-written to its original value before being forwarded by the Switch. For more information on priority queues, CoS queues and mapping for 802.1p, see the QoS section of this manual.
<b>Replace DSCP (0-63)</b>	Select this option to instruct the Switch to replace the DSCP value (in a packet that meets the selected criteria) with the value entered in the adjacent field. When an ACL rule is added to change both the priority and DSCP of an IPv4 packet, only one of them

	can be modified due to a chip limitation. Currently the priority is changed when both the priority and DSCP are set to be modified.
<b>Time Range Name</b>	Tick the check box and enter the name of the Time Range settings that has been previously configured in the <b>Time Range Settings</b> window. This will set specific times when this access rule will be implemented on the Switch.
<b>Counter</b>	Here the user can select the counter. By checking the counter, the administrator can see how many times that the rule was hit.
<b>Port</b>	When a range of ports is to be configured, the Auto Assign check box MUST be ticked in the Access ID field of this window. If not, the user will be presented with an error message and the access rule will not be configured.
<b>Port Group ID</b>	Specify the port group ID to apply to the access rule.
<b>Port Group Name</b>	Specify the port group name to apply to the access rule.
<b>VLAN Name</b>	Specify the VLAN name to apply to the access rule.
<b>VLAN ID</b>	Specify the VLAN ID to apply to the access rule.

Click the <<Back button to discard the changes made and return to the previous page.

Click the **Apply** button to accept the changes made.

After clicking the **Show Details** button in the **Egress Access Rule List**, the following page will appear:

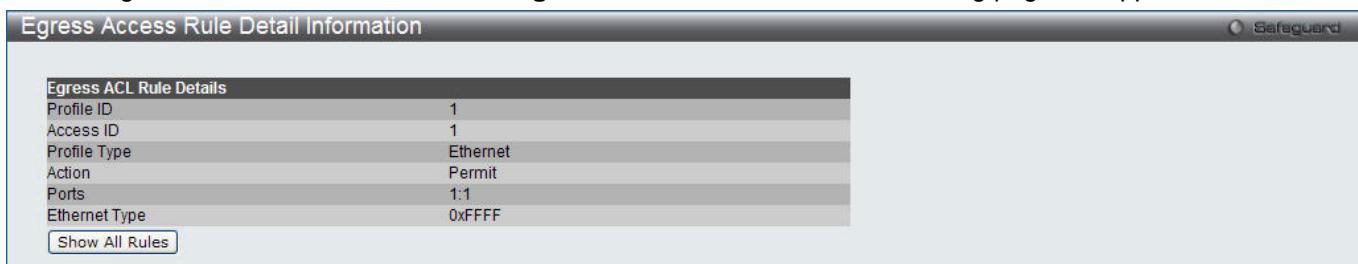

Figure 7-53 Egress Access Rule Detail Information window (Ethernet ACL)

Click the **Show All Rules** button to navigate back to the Access Rule List.

## Adding an IPv4 Egress ACL Profile

The window shown below is the Add Egress ACL Profile window for IPv4. To use specific filtering masks in this egress ACL profile, click the packet filtering mask field to highlight it red. This will add more filed to the mask.

After clicking the **Add Egress ACL** button, the following page will appear:

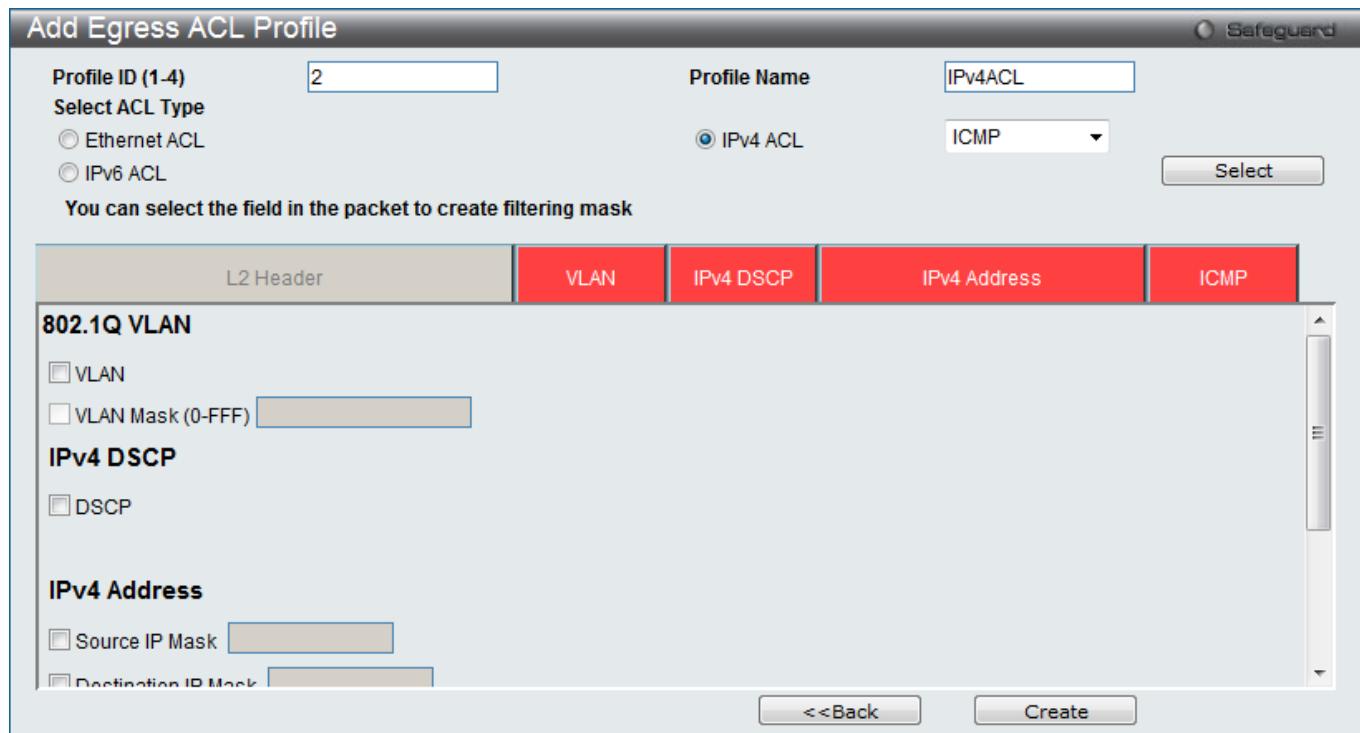

Figure 7-54 Add Egress ACL Profile window (IPv4 ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID (1-4)</b>	Enter a unique identifier number for this profile set. This value can be set from 1 to 4.
<b>Profile Name</b>	Enter a profile name for the profile created.
<b>Select ACL Type</b>	Select profile based on Ethernet (MAC Address), IPv4 address, or IPv6 address. This will change the window according to the requirements for the type of profile. Select Ethernet ACL to instruct the Switch to examine the layer 2 part of each packet header. Select IPv4 ACL to instruct the Switch to examine the IPv4 address in each frame's header. Select IPv6 ACL to instruct the Switch to examine the IPv6 address in each frame's header.
<b>802.1Q VLAN</b>	Selecting this option instructs the Switch to examine the 802.1Q VLAN identifier of each packet header and use this as the full or partial criterion for forwarding.
<b>IPv4 DSCP</b>	Selecting this option instructs the Switch to examine the DiffServ Code part of each packet header and use this as the, or part of the criterion for forwarding.
<b>IPv4 Source IP Mask</b>	Enter an IP address mask for the source IP address.
<b>IPv4 Destination IP Mask</b>	Enter an IP address mask for the destination IP address.
<b>Protocol</b>	Selecting this option instructs the Switch to examine the protocol type value in each frame's header. Then the user must specify what protocol(s) to include according to the following guidelines:  Select <i>ICMP</i> to instruct the Switch to examine the Internet Control Message Protocol (ICMP) field in each frame's header. Select <i>Type</i> to further specify that the access profile will apply an ICMP type value, or

	<p>specify Code to further specify that the access profile will apply an ICMP code value.</p> <p>Select <i>IGMP</i> to instruct the Switch to examine the Internet Group Management Protocol (IGMP) field in each frame's header.</p> <p>Select <i>Type</i> to further specify that the access profile will apply an IGMP type value.</p> <p>Select <i>TCP</i> to use the TCP port number contained in an incoming packet as the forwarding criterion. Selecting TCP requires that you specify a source port mask and/or a destination port mask.</p> <p><i>src port mask</i> - Specify a TCP port mask for the source port in hex form (hex 0x0-0xffff), which you wish to filter.</p> <p><i>dst port mask</i> - Specify a TCP port mask for the destination port in hex form (hex 0x0-0xffff) which you wish to filter.</p> <p><i>flag bit</i> - The user may also identify which flag bits to filter. Flag bits are parts of a packet that determine what to do with the packet. The user may filter packets by filtering certain flag bits within the packets, by checking the boxes corresponding to the flag bits of the TCP field. The user may choose between urg (urgent), ack (acknowledgement), psh (push), rst (reset), syn (synchronize), fin (finish).</p> <p>Select <i>UDP</i> to use the UDP port number contained in an incoming packet as the forwarding criterion. Selecting UDP requires that you specify a source port mask and/or a destination port mask.</p> <p><i>src port mask</i> - Specify a UDP port mask for the source port in hex form (hex 0x0-0xffff).</p> <p><i>dst port mask</i> - Specify a UDP port mask for the destination port in hex form (hex 0x0-0xffff).</p> <p>Select <i>Protocol ID</i> - Enter a value defining the protocol ID in the packet header to mask. Specify the protocol ID mask in hex form (hex 0x0-0xff).</p> <p><i>Protocol ID Mask</i> - Specify that the rule applies to the IP protocol ID traffic.</p> <p><i>User Define</i> - Specify the Layer 4 part mask</p>
--	--

Click the **Select** button to select an ACL type.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the **Create** button to create a profile.

After clicking the **Show Details** button, the following page will appear:

The screenshot shows the 'Egress Access Profile Detail Information' window. At the top, there is a 'Safeguard' icon. Below the title, the section 'Egress ACL Profile Details' is displayed. It contains the following information:

Profile ID	2
Profile Name	IPv4ACL
Profile Type	IP
DSCP	Yes

At the bottom left of the window, there is a 'Show All Profiles' button.

Figure 7-55 Egress Access Profile Detail Information window (IPv4 ACL)

Click the **Show All Profiles** button to navigate back to the **Egress Access Profile List** window.

After clicking the **Add/View Rules** button, the following page will appear:

Egress Access Rule List				Safeguard
<<Back	Add Rule	Consumed HW Entries: 127		
Profile ID	Access ID	Profile Type	Action	
2	1	IP	Permit	Show Details Delete Rules
				1/1 1 Go

Figure 7-56 Egress Access Rule List window (IPv4 ACL)

Click the <<Back button to return to the previous page.

Click the Add Rule button to create a new ACL rule in this profile.

Click the Show Details button to view more information about the specific rule created.

Click the Delete Rules button to remove the specific entry.

Enter a page number and click the Go button to navigate to a specific page when multiple pages exist.

After clicking the Add Rule button, the following page will appear:

Add Egress Access Rule				Safeguard
<b>Profile Information</b>				
Profile ID	2	Profile Name	IPv4ACL	
Profile Type	IP	DSCP	Yes	
<b>Rule Detail</b> (Keep the input field blank to specify that the corresponding option does not matter).				
Access ID (1-128)	1	<input type="checkbox"/> Auto Assign		
DSCP	<input type="text"/> (e.g.: 0-63)			
Rule Action	Action: Permit <input type="checkbox"/> <input type="checkbox"/> Priority (0-7) <input type="checkbox"/> Replace DSCP (0-63) <input type="checkbox"/> Time Range Name <input type="checkbox"/> Counter <input type="checkbox"/> VLAN Name <input type="button" value="▼"/>			
Counter	<input type="checkbox"/> Disabled <input type="checkbox"/> <input type="text"/> (Max: 32 characters)			
<input type="button" value="&lt;&lt;Back"/> <input type="button" value="Apply"/>				

Figure 7-57 Add Egress Access Rule (IPv4 ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Access ID (1-128)</b>	Type in a unique identifier number for this access. This value can be set from 1 to 128. <b>Auto Assign</b> – Tick the check box will instruct the Switch to automatically assign an Access ID for the rule being created.
<b>DSCP</b>	Specify the value of DSCP. The DSCP value ranges from 0 to 63.
<b>Action</b>	Select Permit to specify that the packets that match the access profile are forwarded by the Switch, according to any additional rule added (see below). Select Deny to specify that the packets that match the access profile are not forwarded by the Switch and will be filtered.

<b>Priority (0-7)</b>	Tick the corresponding check box if you want to re-write the 802.1p default priority of a packet to the value entered in the Priority field, which meets the criteria specified previously in this command, before forwarding it on to the specified CoS queue. Otherwise, a packet will have its incoming 802.1p user priority re-written to its original value before being forwarded by the Switch. For more information on priority queues, CoS queues and mapping for 802.1p, see the QoS section of this manual.
<b>Replace DSCP (0-63)</b>	Select this option to instruct the Switch to replace the DSCP value (in a packet that meets the selected criteria) with the value entered in the adjacent field. When an ACL rule is added to change both the priority and DSCP of an IPv4 packet, only one of them can be modified due to a chip limitation. Currently the priority is changed when both the priority and DSCP are set to be modified.
<b>Time Range Name</b>	Tick the check box and enter the name of the Time Range settings that has been previously configured in the <b>Time Range Settings</b> window. This will set specific times when this access rule will be implemented on the Switch.
<b>Counter</b>	Here the user can select the counter. By checking the counter, the administrator can see how many times that the rule was hit.
<b>Ports</b>	When a range of ports is to be configured, the Auto Assign check box MUST be ticked in the Access ID field of this window. If not, the user will be presented with an error message and the access rule will not be configured. Ticking the All Ports check box will denote all ports on the Switch.
<b>Port Group ID</b>	Specify the port group ID to apply to the access rule.
<b>Port Group Name</b>	Specify the port group name to apply to the access rule.
<b>VLAN Name</b>	Specify the VLAN name to apply to the access rule.
<b>VLAN ID</b>	Specify the VLAN ID to apply to the access rule.

Click the <<Back button to discard the changes made and return to the previous page.

Click the **Apply** button to accept the changes made.

After clicking the **Show Details** button in the **Egress Access Rule List**, the following page will appear:

The screenshot shows the 'Egress Access Rule Detail Information' window. At the top, there's a 'Safeguard' button. Below it is a table titled 'Egress ACL Rule Details' with the following data:

Egress ACL Rule Details	
Profile ID	2
Access ID	1
Profile Type	IP
Action	Permit
Ports	1:8
DSCP	3

At the bottom left of the window is a 'Show All Rules' button.

Figure 7-58 Egress Access Rule Detail Information (IPv4 ACL)

Click the **Show All Rules** button to navigate back to the Access Rule List.

## Adding an IPv6 Egress ACL Profile

The window shown below is the Add Egress ACL Profile window for IPv6. To use specific filtering masks in this egress ACL profile, click the packet filtering mask field to highlight it red. This will add more filed to the mask.

After clicking the **Add Egress ACL** button, the following page will appear:

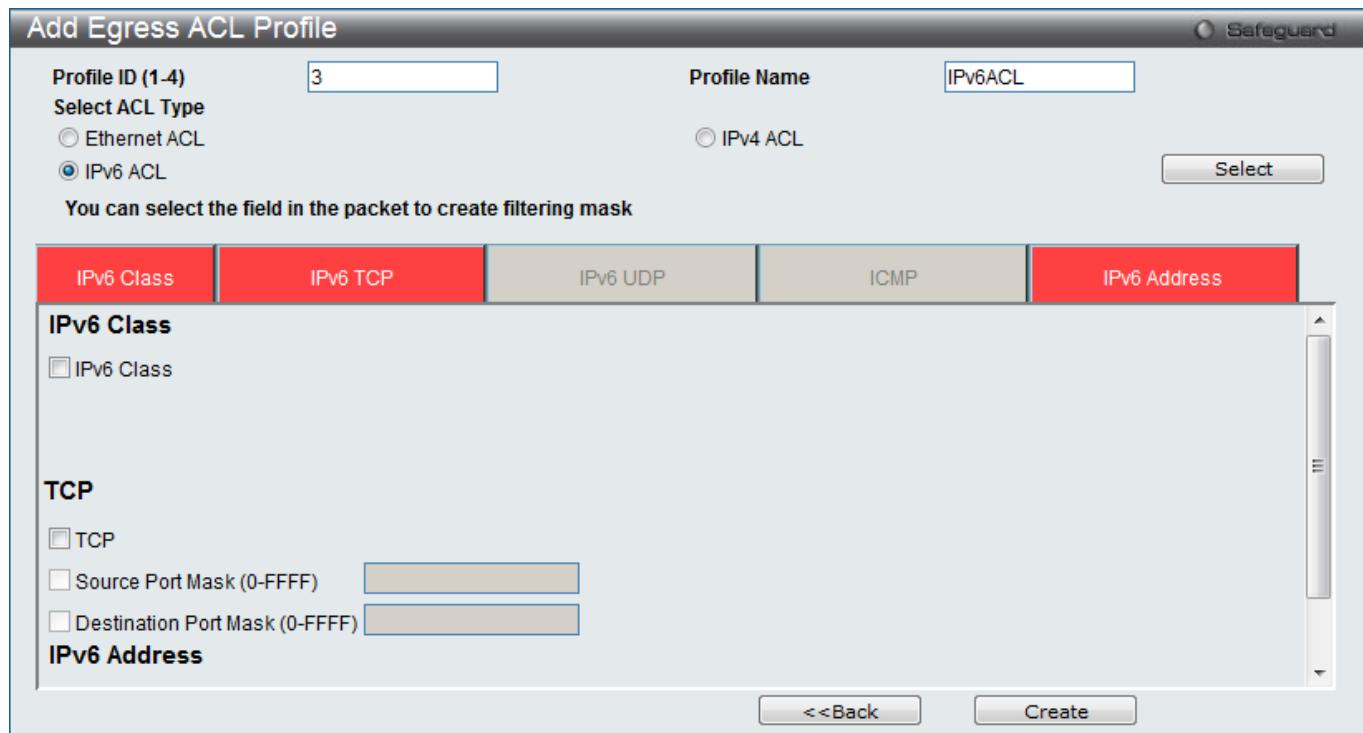

Figure 7-59 Add Egress ACL Profile window (IPv6 ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID (1-4)</b>	Enter a unique identifier number for this profile set. This value can be set from 1 to 4.
<b>Profile Name</b>	Enter a profile name for the profile created.
<b>Select ACL Type</b>	Select profile based on Ethernet (MAC Address), IPv4 address, or IPv6 address. This will change the window according to the requirements for the type of profile. Select Ethernet ACL to instruct the Switch to examine the layer 2 part of each packet header. Select IPv4 ACL to instruct the Switch to examine the IPv4 address in each frame's header. Select IPv6 ACL to instruct the Switch to examine the IPv6 address in each frame's header.
<b>IPv6 Class</b>	Ticking this check box will instruct the Switch to examine the class field of the IPv6 header. This class field is a part of the packet header that is similar to the Type of Service (ToS) or Precedence bits field in IPv4.
<b>IPv6 TCP</b>	<i>Source Port Mask</i> – Specify that the rule applies to the range of TCP source ports. <i>Destination Port Mask</i> – Specify the range of the TCP destination port range.
<b>IPv6 UDP</b>	<i>Source Port Mask</i> – Specify the range of the UDP source port range. <i>Destination Port Mask</i> – Specify the range of the UDP destination port mask.
<b>ICMP</b>	Select ICMP to instruct the Switch to examine the Internet Control Message Protocol (ICMP) field in each frame's header.
<b>IPv6 Source Mask</b>	The user may specify an IPv6 address mask for the source IPv6 address by ticking the corresponding check box and entering the IPv6 address mask, e.g. FFFF:FFFF::FFFF.

<b>IPv6 Destination Mask</b>	The user may specify an IPv6 address mask for the destination IPv6 address by ticking the corresponding check box and entering the IPv6 address mask, e.g. FFFF:FFFF::FFFF.
------------------------------	---

Click the **Select** button to select an ACL type.

Click the **<<Back** button to discard the changes made and return to the previous page.

[<< Back](#) [Apply](#)

Figure 7-62 Add Egress Access Rule (IPv6 ACL)

The fields that can be configured are described below:

Parameter	Description
<b>Access ID (1-128)</b>	Type in a unique identifier number for this access. This value can be set from 1 to 128. <b>Auto Assign</b> – Tick the check box will instruct the Switch to automatically assign an Access ID for the rule being created.
<b>Class</b>	Specify the value of IPv6 class.
<b>Action</b>	Select <i>Permit</i> to specify that the packets that match the access profile are forwarded by the Switch, according to any additional rule added (see below). Select <i>Deny</i> to specify that packets that match the access profile are not forwarded by the Switch and will be filtered.
<b>Priority (0-7)</b>	Tick the corresponding check box to re-write the 802.1p default priority of a packet to the value entered in the Priority field, which meets the criteria specified previously in this command, before forwarding it on to the specified CoS queue. Otherwise, a packet will have its incoming 802.1p user priority re-written to its original value before being forwarded by the Switch. For more information on priority queues, CoS queues and mapping for 802.1p, see the QoS section of this manual.
<b>Replace DSCP (0-63)</b>	Select this option to instruct the Switch to replace the DSCP value (in a packet that meets the selected criteria) with the value entered in the adjacent field. When an ACL rule is added to change both the priority and DSCP of an IPv6 packet, only one of them can be modified due to a chip limitation. Currently the priority is changed when both the priority and DSCP are set to be modified.
<b>Time Range Name</b>	Tick the check box and enter the name of the Time Range settings that has been previously configured in the <b>Time Range Settings</b> window. This will set specific times when this access rule will be implemented on the Switch.
<b>Counter</b>	Here the user can select the counter. By checking the counter, the administrator can see

	how many times that the rule was hit.
<b>Ports</b>	When a range of ports is to be configured, the Auto Assign check box MUST be ticked in the Access ID field of this window. If not, the user will be presented with an error message and the access rule will not be configured. Ticking the All Ports check box will denote all ports on the Switch.
<b>Port Group ID</b>	Specify the port group ID to apply to the access rule.
<b>Port Group Name</b>	Specify the port group name to apply to the access rule.
<b>VLAN Name</b>	Specify the VLAN name to apply to the access rule.
<b>VLAN ID</b>	Specify the VLAN ID to apply to the access rule.

Click the <<Back button to discard the changes made and return to the previous page.

Click the **Apply** button to accept the changes made.

After clicking the **Show Details** button in the **Egress Access Rule List**, the following page will appear:

The screenshot shows the 'Egress Access Rule Detail Information' window. At the top, there's a 'Safeguard' button. Below it is a table titled 'Egress ACL Rule Details' with the following data:

Profile ID	3
Access ID	1
Profile Type	IPv6
Action	Permit
Ports	1:7
IPv6 Class	30

At the bottom left is a 'Show All Rules' button.

Figure 7-63 Egress Access Rule Detail Information (IPv6 ACL)

Click the **Show All Rules** button to navigate back to the Access Rule List.

## Egress ACL Flow Meter

This window is used to configure the packet flow-based metering based on an egress access profile and rule.

To view this window, click **ACL > Egress ACL Flow Meter** as shown below:

The screenshot shows the 'Egress ACL Flow Meter' window. At the top, there are dropdown menus for 'Profile ID' and 'Access ID (1-128)', and a 'Find' button. Below are 'Add', 'View All', and 'Delete All' buttons. A table lists one entry:

Profile ID	Access ID	Mode	Modify	View	Delete
2	1	Meter	Modify	View	Delete

At the bottom right are pagination controls: '1/1' and '1'.

Figure 7-64 Egress ACL Flow Meter window

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID</b>	Here the user can enter the Profile ID for the flow meter.
<b>Profile Name</b>	Here the user can enter the Profile Name for the flow meter.
<b>Access ID (1-128)</b>	Here the user can enter the Access ID for the flow meter.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Add** button to add a new entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Delete All** button to remove all the entries listed.

Click the **Modify** button to re-configure the specific entry.

Click the **View** button to display the information of the specific entry.

Click the **Delete** button to remove the specific entry.

After clicking the **Add** or **Modify** button, the following page will appear:

<input type="button" value="&lt;&lt;Back"/>		<input type="button" value="Apply"/>	

Figure 7-65 Egress ACL Flow Meter Configuration window

The fields that can be configured are described below:

Parameter	Description
<b>Profile ID</b>	Enter the Profile ID for the flow meter.
<b>Profile Name</b>	Enter the Profile Name for the flow meter.
<b>Access ID</b>	Enter the Access ID for the flow meter.
<b>Mode</b>	<b>Rate</b> – Specify the rate for single rate two color mode. <i>Rate</i> – Specify the committed bandwidth in Kbps for the flow. <i>Burst Size</i> – Specify the burst size for the single rate two color mode. The unit is in kilobyte. <i>Rate Exceeded</i> – Specify the action for packets that exceed the committed rate in single rate two color mode. The action can be specified as one of the following: <i>Drop Packet</i> – Drop the packet immediately.

	<p><i>Remark DSCP</i> – Mark the packet with a specified DSCP. The packet is set to drop for packets with a high precedence.</p> <p><b>trTCM</b> – Specify the “two-rate three-color mode.”</p> <p><i>CIR</i> – Specify the Committed information Rate. The unit is Kbps. CIR should always be equal or less than PIR.</p> <p><i>PIR</i> – Specify the Peak information Rate. The unit is Kbps. PIR should always be equal to or greater than CIR.</p> <p><i>CBS</i> – Specify the Committed Burst Size. The unit is in kilobyte.</p> <p><i>PBS</i> – Specify the Peak Burst Size. The unit is in kilobyte.</p> <p><b>srTCM</b> – Specify the “single-rate three-color mode”.</p> <p><i>CIR</i> – Specify the Committed Information Rate. The unit is in kilobyte.</p> <p><i>CBS</i> – Specify the Committed Burst Size. The unit is in kilobyte.</p> <p><i>EBS</i> – Specify the Excess Burst Size. The unit is in kilobyte.</p>
<b>Action</b>	<p><b>Conform</b> – This field denotes the green packet flow. Green packet flows may have their <i>DSCP</i> field rewritten to a value stated in this field. Users may also choose to count green packets by using counter parameter.</p> <p><i>Replace DSCP</i> – Packets that are in the green flow may have their DSCP field rewritten using this parameter and entering the DSCP value to replace.</p> <p><i>Counter</i> – Use this parameter to enable or disable the packet counter for the specified ACL entry in the green flow.</p> <p><b>Exceed</b> – This field denotes the yellow packet flow. Yellow packet flows may have excess packets permitted through or dropped. Users may replace the DSCP field of these packets by checking its radio button and entering a new DSCP value in the allotted field.</p> <p><i>Counter</i> – Use this parameter to enable or disable the packet counter for the specified ACL entry in the yellow flow.</p> <p><b>Violate</b> – This field denotes the red packet flow. Red packet flows may have excess packets permitted through or dropped. Users may replace the DSCP field of these packets by checking its radio button and entering a new DSCP value in the allotted field.</p> <p><i>Counter</i> – Use this parameter to enable or disable the packet counter for the specified ACL entry in the red flow.</p>

## 802.1X

### **802.1X (Port-Based and Host-Based Access Control)**

The IEEE 802.1X standard is a security measure for authorizing and authenticating users to gain access to various wired or wireless devices on a specified Local Area Network by using a Client and Server based access control model. This is accomplished by using a RADIUS server to authenticate users trying to access a network by relaying Extensible Authentication Protocol over LAN (EAPOL) packets between the Client and the Server. The following figure represents a basic EAPOL packet:

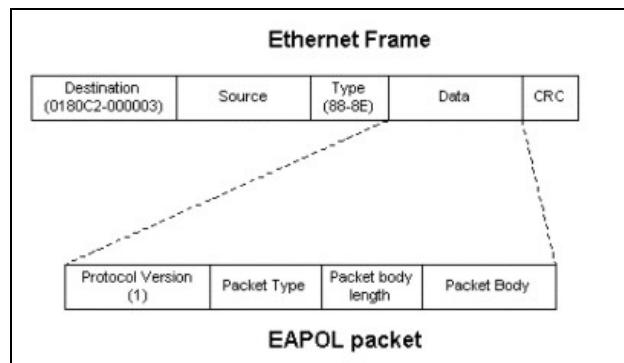

Figure 8-1 The EAPOL Packet

Utilizing this method, unauthorized devices are restricted from connecting to a LAN through a port to which the user is connected. EAPOL packets are the only traffic that can be transmitted through the specific port until authorization is granted. The 802.1X access control method has three roles, each of which are vital to creating and up keeping a stable and working Access Control security method.

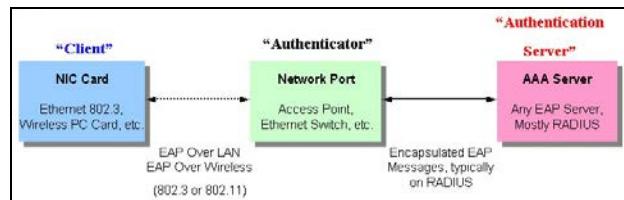

Figure 8-2 The three roles of 802.1X

The following section will explain the three roles of Client, Authenticator and Authentication Server in greater detail.

## Authentication Server

The Authentication Server is a remote device that is connected to the same network as the Client and Authenticator, must be running a RADIUS Server program and must be configured properly on the Authenticator (Switch). Clients connected to a port on the Switch must be authenticated by the Authentication Server (RADIUS) before attaining any services offered by the Switch on the LAN. The role of the Authentication Server is to certify the identity of the Client attempting to access the network by exchanging secure information between the RADIUS server and the Client through EAPOL packets and, in turn, informs the Switch whether or not the Client is granted access to the LAN and/or switches services.

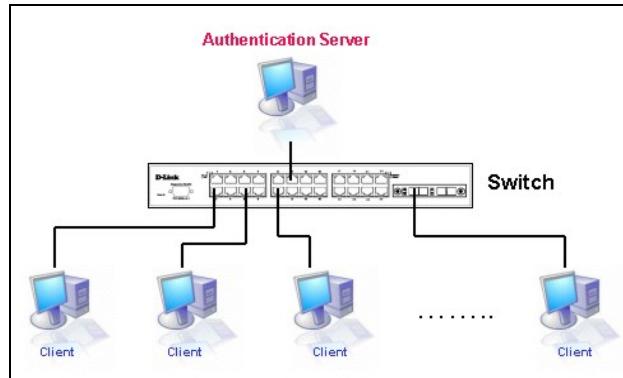

Figure 8-3 The Authentication Server

## Authenticator

The Authenticator (the Switch) is an intermediary between the Authentication Server and the Client. The Authenticator serves two purposes when utilizing the 802.1X function. The first purpose is to request certification information from the Client through EAPOL packets, which is the only information allowed to pass through the Authenticator before access is granted to the Client. The second purpose of the Authenticator is to verify the information gathered from the Client with the Authentication Server, and to then relay that information back to the Client.

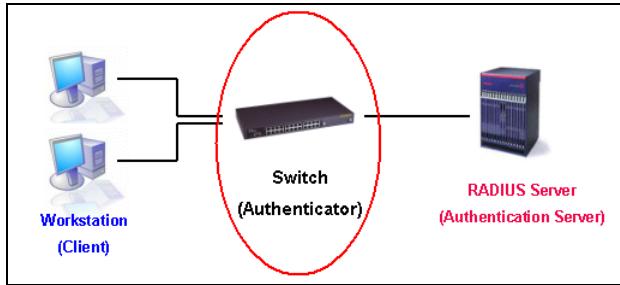

Figure 8-4 The Authenticator

Three steps must be implemented on the Switch to properly configure the Authenticator.

1. The 802.1X State must be *Enabled*. (**Security / 802.1X /802.1X Settings**)
2. The 802.1X settings must be implemented by port (**Security / 802.1X / 802.1X Settings**)
3. A RADIUS server must be configured on the Switch. (**Security / 802.1X / Authentic RADIUS Server**)

## Client

The Client is simply the end station that wishes to gain access to the LAN or switch services. All end stations must be running software that is compliant with the 802.1X protocol. For users running Windows XP and Windows Vista, that software is included within the operating system. All other users are required to attain 802.1X client software from an outside source. The Client will request access to the LAN and or Switch through EAPOL packets and, in turn will respond to requests from the Switch.

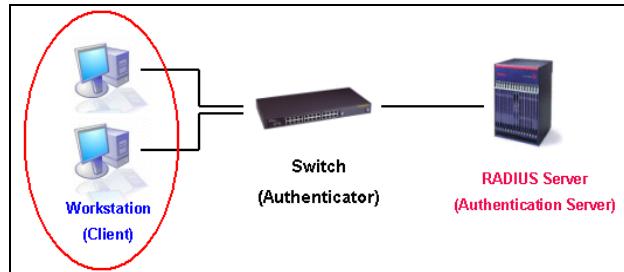

Figure 8-5 The Client

## Authentication Process

Utilizing the three roles stated above, the 802.1X protocol provides a stable and secure way of authorizing and authenticating users attempting to access the network. Only EAPOL traffic is allowed to pass through the specified port before a successful authentication is made. This port is “locked” until the point when a Client with the correct username and password (and MAC address if 802.1X is enabled by MAC address) is granted access and therefore successfully “unlocks” the port. Once unlocked, normal traffic is allowed to pass through the port. The following figure displays a more detailed explanation of how the authentication process is completed between the three roles stated above.

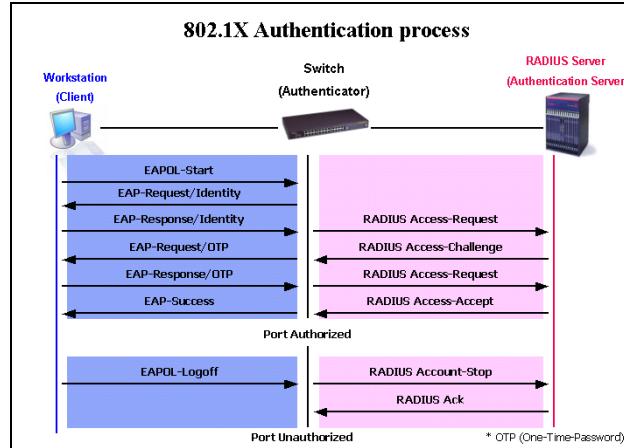

Figure 8-6 The 802.1X Authentication Process

The D-Link implementation of 802.1X allows network administrators to choose between two types of Access Control used on the Switch, which are:

1. Port-Based Access Control – This method requires only one user to be authenticated per port by a remote RADIUS server to allow the remaining users on the same port access to the network.
2. Host-Based Access Control – Using this method, the Switch will automatically learn up to a maximum of 448 MAC addresses by port and set them in a list. Each MAC address must be authenticated by the Switch using a remote RADIUS server before being allowed access to the Network.

## Understanding 802.1X Port-based and Host-based Network Access Control

The original intent behind the development of 802.1X was to leverage the characteristics of point-to-point in LANs. As any single LAN segment in such infrastructures has no more than two devices attached to it, one of which is a Bridge Port. The Bridge Port detects events that indicate the attachment of an active device at the remote end of the link, or an active device becoming inactive. These events can be used to control the authorization state of the Port and initiate the process of authenticating the attached device if the Port is unauthorized. This is the Port-Based Network Access Control.

### Port-based Network Access Control

Once the connected device has successfully been authenticated, the Port then becomes Authorized, and all subsequent traffic on the Port is not subject to access control restriction until an event occurs that causes the Port to become Unauthorized. Hence, if the Port is actually connected to a shared media LAN segment with more than one attached device, successfully authenticating one of the attached devices effectively provides access to the LAN for all devices on the shared segment. Clearly, the security offered in this situation is open to attack.

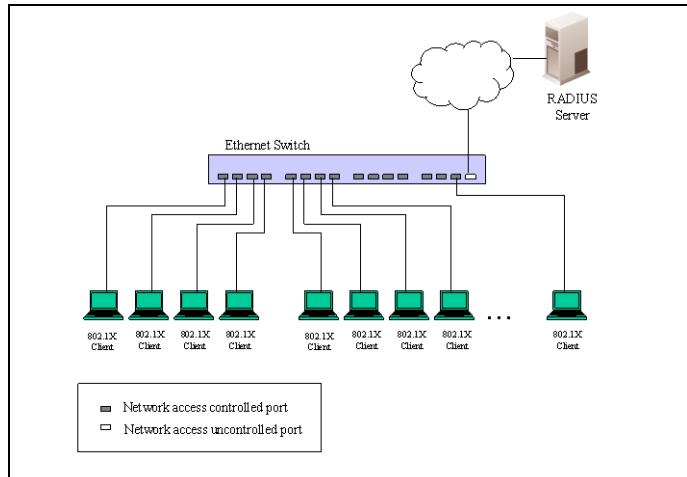

Figure 8-7 Example of Typical Port-based Configuration

### Host-based Network Access Control

In order to successfully make use of 802.1X in a shared media LAN segment, it would be necessary to create “logical” Ports, one for each attached device that required access to the LAN. The Switch would regard the single physical Port connecting it to the shared media segment as consisting of a number of distinct logical Ports, each logical Port being independently controlled from the point of view of EAPOL exchanges and authorization state. The Switch learns each attached devices’ individual MAC addresses, and effectively creates a logical Port that the attached device can then use to communicate with the LAN via the Switch.

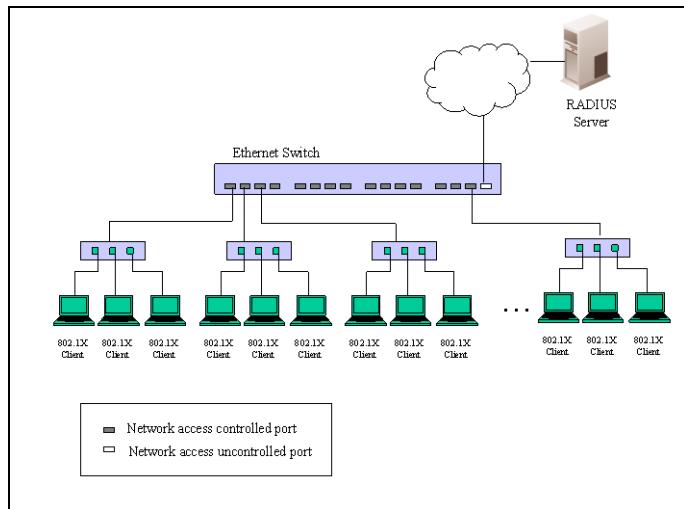

Figure 8-8 Example of Typical Host-based Configuration

## 802.1X Global Settings

Users can configure the 802.1X global parameter.

To view this window, click **Security > 802.1X > 802.1X Global Settings** as shown below:

Authentication State	Disabled	Authentication Protocol	RADIUS EAP
Forward EAPOL PDU	Disabled	Max User (1-448)	448 <input type="checkbox"/> No Limit
RADIUS Authorization	Enabled	<b>Apply</b>	

Figure 8-9 802.1X Global Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Authentication State</b>	Use the drop-down menu to enable or disable the 802.1X function.
<b>Authentication Protocol</b>	Choose the authenticator protocol, <i>Local</i> or <i>RADIUS EAP</i> .
<b>Forward EAPOL PDU</b>	This is a global setting to control the forwarding of EAPOL PDU. When 802.1X functionality is disabled globally or for a port, and if 802.1X forward PDU is enabled both globally and for the port, a received EAPOL packet on the port will be flooded in the same VLAN to those ports for which 802.1X forward PDU is enabled and 802.1X is disabled (globally or just for the port). The default state is disabled.
<b>Max Users</b>	Specifies the maximum number of users. The limit on the maximum users is 448 users. This the <b>No Limit</b> check box to have unlimited users.
<b>RADIUS Authorization</b>	This option is used to enable or disable acceptance of authorized configuration. When the authorization is enabled for 802.1X’s RADIUS, the authorized data assigned by the RADIUS server will be accepted if the global authorization network is enabled.

Click the **Apply** button to accept the changes made.

## 802.1X Port Settings

Users can configure the 802.1X authenticator port settings.

To view this window, click **Security > 802.1X > 802.1X Port Settings** as shown below:

Port	AdmDir	OpenCrlDir	Port Control	TX Period	Quiet Period	Supp-TIMEOUT	Server-TIMEOUT	MaxReq	ReAuth Period	ReAuth	Capability	Forward EAPOL PDU	Max User
1	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
2	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
3	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
4	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
5	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
6	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
7	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
8	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
9	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
10	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
11	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
12	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
13	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16
14	Both	Both	Auto	30	60	30	30	2	3600	Disabled	None	Disabled	16

Figure 8-10 802.1X Port Settings

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select a range of ports you wish to configure.
<b>QuietPeriod</b>	This allows the user to set the number of seconds that the Switch remains in the quiet state following a failed authentication exchange with the client. The default setting is 60 seconds.
<b>SuppTimeout</b>	This value determines timeout conditions in the exchanges between the Authenticator and the client. The default setting is 30 seconds. It is defined in SuppTimeout, IEEE-802.1X-2001, page 47. The initialization value is used for the awhile timer when timing out the Supplicant. Its default value is 30 seconds; however, if the type of challenge involved in the current exchange demands a different value of timeout (for example, if the challenge requires an action on the part of the user), then the timeout value is adjusted accordingly. It can be set by management to any value in the range from 1 to 65535 seconds.

<b>ServerTimeout</b>	This value determines timeout conditions in the exchanges between the Authenticator and the authentication server. The default setting is 30 seconds.
<b>MaxReq</b>	The maximum number of times that the Switch will retransmit an EAP Request to the client before it times out of the authentication sessions. The default setting is 2. It is defined in MaxReq, IEEE-802.1X-2001 page 47. The maximum number of times that the state machine will retransmit an EAP Request packet to the Supplicant before it times out the authentication session. Its default value is 2; it can be set by management to any value in the range from 1 to 10.
<b>TxPeriod</b>	This sets the TxPeriod of time for the authenticator PAE state machine. This value determines the period of an EAP Request/Identity packet transmitted to the client. The default setting is 30 seconds.
<b>ReAuthPeriod</b>	A constant that defines a nonzero number of seconds between periodic re-authentication of the client. The default setting is 3600 seconds.
<b>ReAuthentication</b>	Determines whether regular re-authentication will take place on this port. The default setting is <i>Disabled</i> .
<b>Port Control</b>	<p>This allows the user to control the port authorization state.</p> <ul style="list-style-type: none"> <li>• Select <i>ForceAuthorized</i> to disable 802.1X and cause the port to transition to the authorized state without any authentication exchange required. This means the port transmits and receives normal traffic without 802.1X-based authentication of the client.</li> <li>• If <i>ForceUnauthorized</i> is selected, the port will remain in the unauthorized state, ignoring all attempts by the client to authenticate. The Switch cannot provide authentication services to the client through the interface.</li> <li>• If <i>Auto</i> is selected, it will enable 802.1X and cause the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port transitions from down to up, or when an EAPOL-start frame is received. The Switch then requests the identity of the client and begins relaying authentication messages between the client and the authentication server.</li> </ul> <p>The default setting is <i>Auto</i>.</p>
<b>Capability</b>	This allows the 802.1X Authenticator settings to be applied on a per-port basis. Select <i>Authenticator</i> to apply the settings to the port. When the setting is activated, a user must pass the authentication process to gain access to the network. Select <i>None</i> disable 802.1X functions on the port.
<b>Direction</b>	Sets the administrative-controlled direction to <i>Both</i> or <i>In</i> . If <i>Both</i> is selected, control is exerted over both incoming and outgoing traffic through the controlled port selected in the first field. If <i>In</i> is selected, the control is only exerted over incoming traffic through the port the user selected in the first field.
<b>Forward EAPOL PDU</b>	This is a port-based setting to control the forwarding of EAPOL PDU. When 802.1X functionality is disabled globally or for a port, and if 802.1X forward PDU is enabled both globally and for the port, a received EAPOL packet on the port will be flooded in the same VLAN to those ports for which 802.1X forward PDU is enabled and 802.1X is disabled (globally or just for the port). The default state is disabled.
<b>Max Users</b>	Specifies the maximum number of users. The maximum user limit is 448 users. The default is 16.

Click the **Refresh** button to refresh the display table so that new entries will appear.

Click the **Apply** button to accept the changes made.

## 802.1X User Settings

Users can set different 802.1X users in switch's local database.

To view this window, click **Security > 802.1X > 802.1X User Settings** as shown below:

802.1X User Table Total Entries: 1		
User Name	Password	
XUser	*****	<input type="button" value="Delete"/>

Figure 8-11 802.1X User Settings window

The fields that can be configured are described below:

Parameter	Description
<b>802.1X User</b>	The user can enter an 802.1X user's username in here.
<b>Password</b>	The user can enter an 802.1X user's password in here.
<b>Confirm Password</b>	The user can re-enter an 802.1X user's password in here.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry.

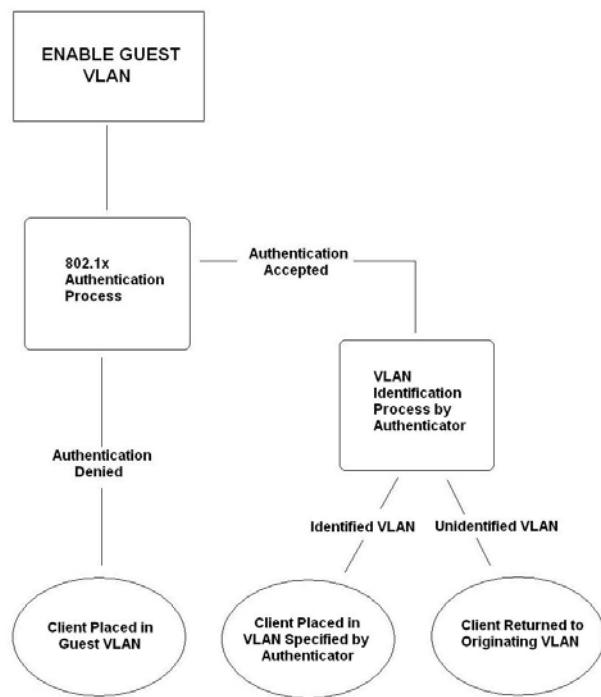

**NOTE:** The **802.1X User** and **Password** values should be less than 16 characters.

## Guest VLAN Settings

On 802.1X security-enabled networks, there is a need for non- 802.1X supported devices to gain limited access to the network, due to lack of the proper 802.1X software or incompatible devices, such as computers running Windows 98 or older operating systems, or the need for guests to gain access to the network without full authorization or local authentication on the Switch. To supplement these circumstances, this switch now implements 802.1X Guest VLANs. These VLANs should have limited access rights and features separate from other VLANs on the network.

To implement 802.1X Guest VLANs, the user must first create a VLAN on the network with limited rights and then enable it as an 802.1X guest VLAN. Then the administrator must configure the guest accounts accessing the Switch to be placed in a Guest VLAN when trying to access the Switch. Upon initial entry to the Switch, the client wishing services on the Switch will need to be authenticated by a remote RADIUS Server or local authentication on the Switch to be placed in a fully operational VLAN.

**Figure 8-12 Guest VLAN Authentication Process**

If authenticated and the authenticator possess the VLAN placement information, that client will be accepted into the fully operational target VLAN and normal switch functions will be open to the client. If the authenticator does not have target VLAN placement information, the client will be returned to its originating VLAN. Yet, if the client is denied authentication by the authenticator, it will be placed in the Guest VLAN where it has limited rights and access. The adjacent figure should give the user a better understanding of the Guest VLAN process.

#### Limitations Using the Guest VLAN

1. Ports supporting Guest VLANs cannot be GVRP enabled and vice versa.
2. A port cannot be a member of a Guest VLAN and a static VLAN simultaneously.
3. Once a client has been accepted into the target VLAN, it can no longer access the Guest VLAN.

Remember, to set an 802.1X guest VLAN, the user must first configure a normal VLAN, which can be enabled here for guest VLAN status. Only one VLAN may be assigned as the 802.1X guest VLAN.

To view this window, click **Security > 802.1X > Guest VLAN Settings** as shown below:

Port	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26
All	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>																							

Ports:

Current Guest VLAN Ports:

**Figure 8-13 Guest VLAN Settings window**

The fields that can be configured are described below:

Parameter	Description
VLAN Name	Enter the pre-configured VLAN name to create as an 802.1X guest VLAN.
Unit	Select the unit you wish to configure.
Port	Set the ports to be enabled for the 802.1X guest VLAN. Click the <b>All</b> button to select all the ports.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry based on the information entered.

## Authenticator State

This window is used to display the authenticator state.

This window appears when the **Authentication State** is enabled in **802.1X Global Settings** window.

To view this window, click **Security > 802.1X > Authenticator State** as shown below:

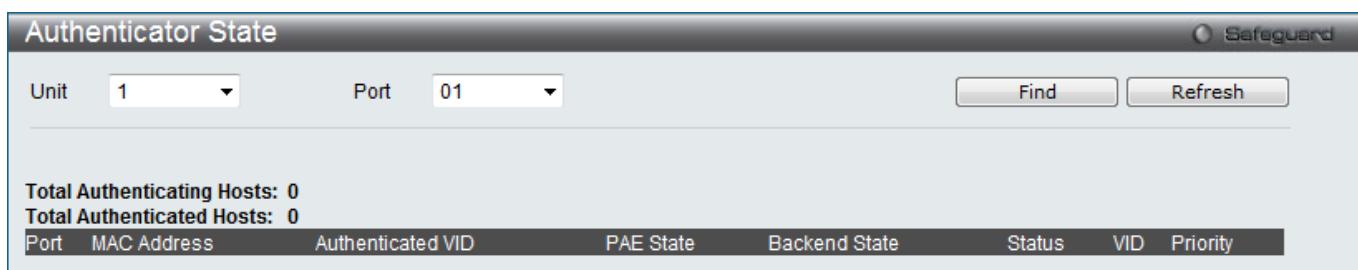

Figure 8-14 Authenticator State Window

The fields that can be configured are described below:

Parameter	Description
Unit	Select a unit you want to display.
Port	Use the drop-down menu to select a port to display.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Refresh** button to refresh the display table so that new entries will appear.

## Authenticator Statistics

This window is used to display the authenticator statistics information.

This window appears when the **Authentication State** is enabled in **802.1X Global Settings** window.

To view this window, click **Security > 802.1X > Authenticator Statistics** as shown below:

Authenticator Statistics				Safeguard
Unit	1	Port	01	Apply
<b>Index</b>				
1	null	null	null	
2	null	null	null

Parameter	Description
Unit	Select a unit you want to display.
Port	Use the drop-down menu to select a port to display.

Click the **Apply** button to accept the changes made.

## Initialize Port-based Port(s)

This window is used to initialize the 802.1X authentication state machine of port-based ports and displays the current initialized port-based ports.

This window appears when the **Authentication State** is enabled in **802.1X Global Settings** window.

To view this window, click **Security > 802.1X > Initialize Port-based Port(s)** as shown below:

Initialize Port-based Port(s)								
Unit	1	From Port	▼	To Port	▼	Apply		
Port	MAC Address	Authenticated VID	PAE State	Backend State	Status	VID	Priority	

**Figure 8-18 Initialize Port-based Port(s) Window**

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select a unit you want to display.
<b>From Port / To Port</b>	Use the drop-down menus to select a range of ports to initialize.

Click the **Apply** button to accept the changes made.

## Initialize Host-based Port(s)

This window is used to initialize the 802.1X authentication state machine of host-based ports.

This window appears when the **Authentication State** is enabled in **802.1X Global Settings** window.

To view this window, click **Security > 802.1X > Initialize Host-based Port(s)** as shown below:

**Figure 8-19 Initialize Host-based Port(s) Window**

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select a unit you want to display.
<b>From Port / To Port</b>	Use the drop-down menus to select a range of ports to initialize.
<b>MAC Address</b>	Tick the check box and enter the MAC address of the Switch connected to the corresponding port, if any.

Click the **Apply** button to accept the changes made.

## Reauthenticate Port-based Port(s)

This window is used to re-authenticate the device connected with the port-based ports and display the current status of the re-authenticated port-based port(s).

This window appears when the **Authentication State** is enabled in **802.1X Global Settings** window.

To view this window, click **Security > 802.1X > Reauthenticate Port-based Port(s)** as shown below:

**Figure 8-20 Reauthenticate Port-based Port(s) Window**

The fields that can be configured are described below:

Parameter	Description

<b>Unit</b>	Select a unit you want to display.
<b>From Port / To Port</b>	Use the drop-down menus to select a range of ports to re-authenticated.

Click the **Apply** button to accept the changes made.

## Reauthenticate Host-based Port(s)

This window is used to re-authenticate the device connected with the host-based ports.

This window appears when the **Authentication State** is enabled in **802.1X Global Settings** window.

To view this window, click **Security > 802.1X > Reauthenticate Host-based Port(s)** as shown below:

**Figure 8-21 Reauthenticate Host-based Port(s) Window**

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select a unit you want to display.
<b>From Port / To Port</b>	Use the drop-down menus to select a range of ports to re-authenticated.
<b>MAC Address</b>	Tick the check box and enter the MAC address.

Click the **Apply** button to accept the changes made.

## RADIUS

### Authentication RADIUS Server Settings

The RADIUS feature of the Switch allows the user to facilitate centralized user administration as well as providing protection against a sniffing, active hacker.

To view this window, click **Security > RADIUS > Authentication RADIUS Server Settings** as shown below:

Index	IP Address	Auth-Port	Acct-Port	Timeout	Retransmit	Key
1						
2						
3						

Figure 8-22 Authentication RADIUS Server Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Index</b>	Choose the desired RADIUS server to configure: 1, 2 or 3 and select the IPv4 Address.
<b>IPv4 Address</b>	Set the RADIUS server IP address.
<b>IPv6 Address</b>	Set the RADIUS server IPv6 address.
<b>Authentication Port (1-65535)</b>	Set the RADIUS authentication server(s) UDP port which is used to transmit RADIUS data between the Switch and the RADIUS server.
<b>Accounting Port (1-65535)</b>	Set the RADIUS account server(s) UDP port which is used to transmit RADIUS accounting statistics between the Switch and the RADIUS server.
<b>Timeout (1-255)</b>	Set the RADIUS server age-out, in seconds.
<b>Retransmit (1-20)</b>	Set the RADIUS server retransmit time, in times.
<b>Key</b>	Set the key the same as that of the RADIUS server.
<b>Confirm Key</b>	Confirm the key the same as that of the RADIUS server.

Click the **Apply** button to accept the changes made.

## RADIUS Authentication

Users can display information concerning the activity of the RADIUS authentication client on the client side of the RADIUS authentication protocol.

To view this window, click **Security > RADIUS > RADIUS Authentication** as shown below:

Figure 8-23 RADIUS Authentication window

The user may also select the desired time interval to update the statistics, between 1s and 60s, where “s” stands for seconds. The default value is one second.

The fields that can be configured are described below:

Parameter	Description
<b>InvalidServerAddr</b>	The number of RADIUS Access-Response packets received from unknown addresses.
<b>Identifier</b>	The NAS-Identifier of the RADIUS authentication client.
<b>ServerIndex</b>	The identification number assigned to each RADIUS Authentication server that the client shares a secret with.
<b>AuthServerAddr</b>	The (conceptual) table listing the RADIUS authentication servers with which the client shares a secret.
<b>ServerPortNumber</b>	The UDP port the client is using to send requests to this server.
<b>RoundTripTime</b>	The time interval (in hundredths of a second) between the most recent Access-Reply/Access-Challenge and the Access-Request that matched it from this RADIUS authentication server.
<b>AccessRequests</b>	The number of RADIUS Access-Request packets sent to this server. This does not include retransmissions.
<b>AccessRetrans</b>	The number of RADIUS Access-Request packets retransmitted to this RADIUS authentication server.
<b>AccessAccepts</b>	The number of RADIUS Access-Accept packets (valid or invalid) received from this server.
<b>AccessRejects</b>	The number of RADIUS Access-Reject packets (valid or invalid) received from this server.
<b>AccessChallenges</b>	The number of RADIUS Access-Challenge packets (valid or invalid) received from this server.
<b>AccessResponses</b>	The number of malformed RADIUS Access-Response packets received from this server. Malformed packets include packets with an invalid length. Bad authenticators or Signature attributes or known types are not included as malformed access responses.
<b>BadAuthenticators</b>	The number of RADIUS Access-Response packets containing invalid authenticators or Signature attributes received from this server.

<b>PendingRequests</b>	The number of RADIUS Access-Request packets destined for this server that have not yet timed out or received a response. This variable is incremented when an Access-Request is sent and decremented due to receipt of an Access-Accept, Access-Reject or Access-Challenge, a timeout or retransmission.
<b>Timeouts</b>	The number of authentication timeouts to this server. After a timeout the client may retry to the same server, send to a different server, or give up. A retry to the same server is counted as a retransmit as well as a timeout. A send to a different server is counted as a Request as well as a timeout.
<b>UnknownTypes</b>	The number of RADIUS packets of unknown type which were received from this server on the authentication port
<b>PacketsDropped</b>	The number of RADIUS packets of which were received from this server on the authentication port and dropped for some other reason.

Click the **Clear** button to clear the current statistics shown.

## RADIUS Account Client

Users can display managed objects used for managing RADIUS accounting clients, and the current statistics associated with them.

To view this window, click **Security > RADIUS > RADIUS Account Client** as shown below:

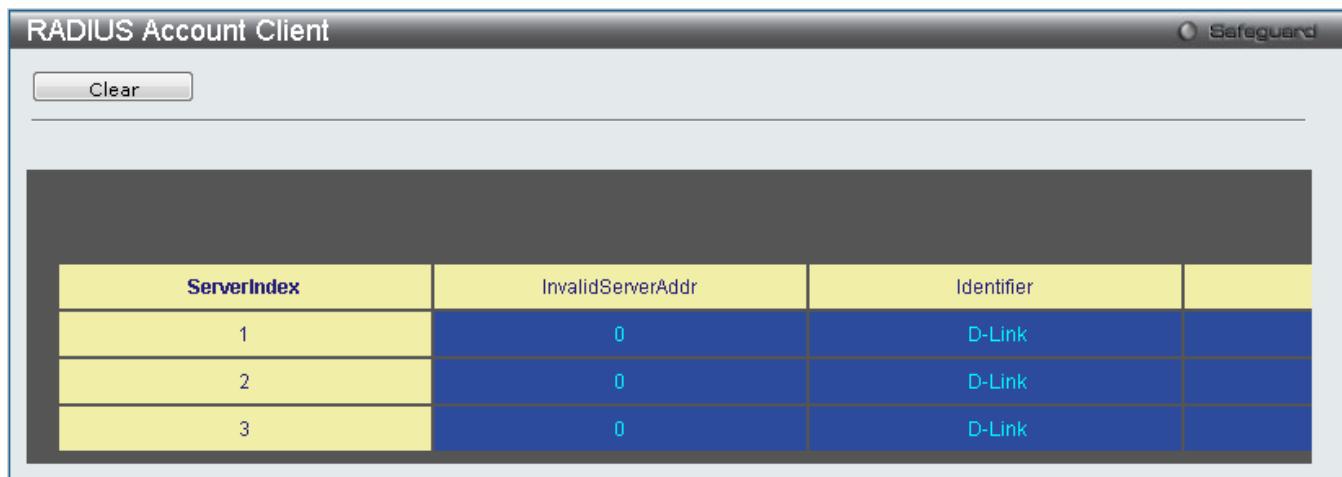

Figure 8-24 RADIUS Account Client window

The user may also select the desired time interval to update the statistics, between 1s and 60s, where "s" stands for seconds. The default value is one second.

The fields that can be configured are described below:

Parameter	Description
<b>ServerIndex</b>	The identification number assigned to each RADIUS Accounting server that the client shares a secret with.
<b>InvalidServerAddr</b>	The number of RADIUS Accounting-Response packets received from unknown addresses.
<b>Identifier</b>	The NAS-Identifier of the RADIUS accounting client.
<b>ServerAddr</b>	The IP address of the RADIUS authentication server referred to in this table entry.
<b>ServerPortNumber</b>	The UDP port the client is using to send requests to this server.

<b>RoundTripTime</b>	The time interval between the most recent Accounting-Response and the Accounting-Request that matched it from this RADIUS accounting server.
<b>Requests</b>	The number of RADIUS Accounting-Request packets sent. This does not include retransmissions.
<b>Retransmissions</b>	The number of RADIUS Accounting-Request packets retransmitted to this RADIUS accounting server. Retransmissions include retries where the Identifier and Acct-Delay have been updated, as well as those in which they remain the same.
<b>Responses</b>	The number of RADIUS packets received on the accounting port from this server.
<b>MalformedResponses</b>	The number of malformed RADIUS Accounting-Response packets received from this server. Malformed packets include packets with an invalid length. Bad authenticators and unknown types are not included as malformed accounting responses.
<b>BadAuthenticators</b>	The number of RADIUS Accounting-Response packets, which contained invalid authenticators, received from this server.
<b>PendingRequests</b>	The number of RADIUS Accounting-Request packets sent to this server that have not yet timed out or received a response. This variable is incremented when an Accounting-Request is sent and decremented due to receipt of an Accounting-Response, a timeout or a retransmission.
<b>Timeouts</b>	The number of accounting timeouts to this server. After a timeout the client may retry to the same server, send to a different server, or give up. A retry to the same server is counted as a retransmit as well as a timeout. A send to a different server is counted as an Accounting-Request as well as a timeout.
<b>UnknownTypes</b>	The number of RADIUS packets of unknown type which were received from this server on the accounting port.
<b>PacketsDropped</b>	The number of RADIUS packets, which were received from this server on the accounting port and dropped for some other reason.

Click the **Clear** button to clear the current statistics shown.

## IP-MAC-Port Binding (IMPB)

The IP network layer uses a IPv4/IPv6 address. The Ethernet link layer uses a MAC address. Binding these two address types together allows the transmission of data between the layers. The primary purpose of IP-MAC-port binding is to restrict the access to a switch to a number of authorized users. Authorized clients can access a switch's port by either checking the pair of IP-MAC addresses with the pre-configured database or if DHCP snooping has been enabled in which case the switch will automatically learn the IP/MAC pairs by snooping DHCP packets and saving them to the IMPB white list. If an unauthorized user tries to access an IP-MAC binding enabled port, the system will block the access by dropping its packet. For the xStack® DGS-3420 series of switches, active and inactive entries use the same database. The maximum number of IPv4/IPv6 entries is 510/511. The creation of authorized users can be manually configured by CLI or Web. The function is port-based, meaning a user can enable or disable the function on the individual port.

## IMPB Global Settings

Users can enable or disable the Trap/Log State and DHCP Snoop state on the Switch. The Trap/Log field will enable and disable the sending of trap/log messages for IP-MAC-port binding. When enabled, the Switch will send a trap message to the SNMP agent and the Switch log when an ARP/IP packet is received that doesn't match the IP-MAC-port binding configuration set on the Switch.

To view this window, click **Security > IP-MAC-Port Binding (IMPB) > IMPB Global Settings** as shown below:

**IMPB Global Settings**

Roaming State	<input checked="" type="radio"/> Enabled	<input type="radio"/> Disabled
Trap / Log	<input type="radio"/> Enabled	<input checked="" type="radio"/> Disabled

Address Binding DHCP Snooping Entry File : <input type="text" value="dhcpsnp.cfg"/> (Max: 64 characters)		
Auto Save	<input checked="" type="radio"/> Enabled	<input type="radio"/> Disabled
		<b>Apply</b>
Save DHCP Snooping Binding Entry		<b>Save</b>

**Figure 8-25 IMPB Global Settings**

The fields that can be configured are described below:

Parameter	Description
<b>Roaming State</b>	Select to enable or disable the roaming state. When IMPB roaming is enabled, the dynamic authenticated MAC address which learned through DHCP/ND snooping on specific port can change to another port if it detects (1) a new DHCP process belong to same IP and MAC address or (2) a new DAD process belong to same IP and MAC.
<b>Trap / Log</b>	Click the radio buttons to enable or disable the sending of trap/log messages for IP-MAC-port binding. When <i>Enabled</i> , the Switch will send a trap message to the SNMP agent and the Switch log when an ARP/IP packet is received that doesn't match the IP-MAC-port binding configuration set on the Switch. The default is <i>Disabled</i> .
<b>DHCP Snooping (IPv4)</b>	Click the radio buttons to enable or disable DHCP snooping (IPv4) for IP-MAC-port binding. The default is <i>Disabled</i> .
<b>DHCP Snooping (IPv6)</b>	Click the radio buttons to enable or disable DHCP snooping (IPv6) for IP-MAC-port binding. The default is <i>Disabled</i> .
<b>ND Snooping</b>	Click the radio buttons to enable or disable enable ND snooping on the Switch. The default is <i>Disabled</i> .
<b>Recover Learning Ports</b>	Enter the port numbers used to recover the learning port state. Tick the <b>All</b> check box to apply to all ports.
<b>File Name</b>	This option is used to download or upload DHCPv4 Snooping binding entries by TFTP. Enter the file path, to the TFTP server, here. Alternatively, click on the <b>Browse</b> button and navigate to the file located on the PC. Click the <b>Download</b> button to initiate the download. Click the <b>Upload</b> button to initiate the upload.
<b>Address Binding DHCP Snooping Entry File</b>	This option is used to save the DHCPv4 snooping binding entries. Enter the filename here. <b>Note:</b> This feature is only supported on devices that support external memory (e.g. SD card).
<b>Auto Save</b>	Select to enable or disable the automatic save option.

<b>Save DHCP Snooping Binding Entry</b>	Click the <b>Save</b> button to manually initiate the saving of the DHCP snooping binding entry here.
---	---

Click the **Apply** button to accept the changes made for each individual section.

## IMPB Port Settings

Select a port or a range of ports with the From Port and To Port fields. Enable or disable the port with the State, Allow Zero IP and Forward DHCP Packet field, and configure the port's Max Entry.

To view this window, click **Security > IP-MAC-Port Binding (IMPB) > IMPB Port Settings** as shown below:

The screenshot shows the 'IMPB Port Settings' window. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), 'To Port' (set to 01), and several inspection and protocol settings. Below this is a table with 17 rows, each representing a port from 2 to 17. The columns in the table are: Port, ARP Inspection, IP Inspection, ND Inspection, Protocol, Zero IP, DHCP Packet, and Stop Learning Threshold/Mode. Most ports have 'Disabled' in all columns except 'Protocol' which is set to 'All'. Port 1 has 'Enabled' in the 'DHCP Packet' column and '500' in the 'Stop Learning Threshold' column. An 'Apply' button is located at the bottom right of the window.

Port	ARP Inspection	IP Inspection	ND Inspection	Protocol	Zero IP	DHCP Packet	Stop Learning Threshold/Mode
2	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
3	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
4	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
5	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
6	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
7	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
8	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
9	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
10	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
11	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
12	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
13	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
14	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
15	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
16	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal
17	Disabled	Disabled	Disabled	All	Not Allow	Forward	500/Normal

Figure 8-26 IMPB Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select a range of ports to set for IP-MAC-port binding.
<b>ARP Inspection</b>	<p>When the ARP inspection function is enabled, the legal ARP packets are forwarded, while the illegal packets are dropped.</p> <p><i>Disabled</i> - Disable the ARP inspection function.</p> <p><i>Enabled (Strict)</i> - This mode disables hardware learning of the MAC address. All packets are dropped by default until a legal ARP or IP packets are detected. When enabling this mode, the Switch stops writing dropped FDB entries on these ports. If detecting legal packets, the Switch needs to write forward FDB entry.</p> <p><i>Enabled (Loose)</i> - In this mode, all packets are forwarded by default until an illegal ARP packet is detected.</p> <p>The default value is <i>Disabled</i>.</p>

<b>IP Inspection</b>	When both ARP and IP inspections are enabled, all IP packets are checked. The legal IP packets are forwarded, while the illegal IP packets are dropped. When IP Inspection is enabled, and ARP Inspection is disabled, all non-IP packets (Ex. L2 packets, or ARP) are forwarded by default. The default value is <i>Disabled</i> .
<b>ND Inspection</b>	Select to enable or disable enable ND snooping on the Switch. The default is <i>Disabled</i> .
<b>Protocol</b>	Use the drop-down menu to select the protocol types, <i>IPv4</i> , <i>IPv6</i> or <i>All</i> .
<b>Zero IP</b>	Use the drop-down menu to enable or disable this feature. Allow zero IP configures the state which allows ARP packets with 0.0.0.0 source IP to bypass.
<b>DHCP Packet</b>	By default, the DHCP packet with broadcast DA will be flooded. When set to disable, the broadcast DHCP packet received by the specified port will not be forwarded in strict mode. This setting is effective when DHCP snooping is enabled, in the case when a DHCP packet which has been trapped by the CPU needs to be forwarded by the software. This setting controls the forwarding behavior in this situation.
<b>Stop Learning Threshold</b>	Here is displayed the number of blocked entries on the port. The default value is <i>500</i> .

Click the **Apply** button to accept the changes made.

## IMPB Entry Settings

This window is used to create static IP-MAC-binding port entries and view all IMPB entries on the Switch.

To view this window, click **Security > IP-MAC-Port Binding (IMPB) > IMPB Entry Settings** as shown below:

The screenshot shows the 'IMPB Entry Settings' window. At the top, there are radio buttons for 'IPv4 Address' (selected) and 'IPv6 Address', followed by input fields for 'MAC Address' and 'Ports (e.g.: 1:4, 3:6-3:7)'. Below these are buttons for 'Apply', 'Find', 'View All', and 'Delete All'. A message 'Total Entries: 1' is displayed above a table. The table has columns: IP Address, MAC Address, Ports, ACL Status, and Mode. One entry is listed: IP Address 192.168.69.222, MAC Address 00-11-22-33-44-55, Ports 2, ACL Status Inactive, and Mode Static. Buttons for 'Edit' and 'Delete' are next to the entry, and a 'Go' button is at the bottom right of the table area.

Figure 8-27 IMPB Entry Settings window

The fields that can be configured are described below:

Parameter	Description
<b>IPv4 Address</b>	Click the radio button and enter the IP address to bind to the MAC address set below.
<b>IPv6 Address</b>	Click the radio button and enter the IPv6 address to bind to the MAC address set below.
<b>MAC Address</b>	Enter the MAC address to bind to the IP Address set above.
<b>Ports</b>	Specify the switch ports for which to configure this IP-MAC binding entry (IP Address + MAC Address). Tick the <b>All Ports</b> check box to configure this entry for all ports on the Switch.

Click the **Apply** button to accept the changes made.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Delete All** button to remove all the entries listed.

Click the **Edit** button to configure the specified entry.

Click the **Delete** button to remove the specified entry.

## MAC Block List

This window is used to view unauthorized devices that have been blocked by IP-MAC binding restrictions.

To view this window, click **Security > IP-MAC-Port Binding (IMPB) > MAC Block List** as shown below:

The screenshot shows the 'MAC Block List' window. At the top, there are two input fields: 'VLAN Name' and 'MAC Address', each with a corresponding text input box. To the right of these fields are two buttons: 'Find' and 'Safeguard'. Below these buttons are two more buttons: 'View All' and 'Delete All'. A message 'Total Entries: 0' is displayed above the table. The table has a header row with columns labeled 'VID', 'VLAN Name', 'MAC Address', and 'Port'. The table body is currently empty.

**Figure 8-28 MAC Block List**

The fields that can be configured are described below:

Parameter	Description
VLAN Name	Enter a VLAN Name.
MAC Address	Enter a MAC address.

Click the **Find** button to find an unauthorized device that has been blocked by the IP-MAC binding restrictions

Click the **View All** button to display all the existing entries.

Click the **Delete All** button to remove all the entries listed.

## DHCP Snooping

### DHCP Snooping Maximum Entry Settings

Users can configure the maximum DHCP snooping entry for ports on this page.

To view this window, click **Security > IP-MAC-Port Binding (IMPB) > DHCP Snooping > DHCP Snooping Maximum Entry Settings** as shown below:

Port	Maximum Entry	Maximum IPv6 Entry
1	No Limit	No Limit
2	No Limit	No Limit
3	No Limit	No Limit
4	No Limit	No Limit
5	No Limit	No Limit
6	No Limit	No Limit
7	No Limit	No Limit
8	No Limit	No Limit
9	No Limit	No Limit
10	No Limit	No Limit
11	No Limit	No Limit
12	No Limit	No Limit

Figure 8-29 DHCP Snooping Max Entry Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menus to select a range of ports to use.
<b>Maximum Entry (1-50)</b>	Enter the maximum entry value. Tick the <b>No Limit</b> check box to have unlimited maximum number of the learned entries.
<b>Maximum IPv6 Entry (1-50)</b>	Enter the maximum entry value for IPv6 DHCP Snooping. Tick the <b>No Limit</b> check box to have unlimited maximum number of the learned entries.

Click the **Apply** button to accept the changes made.

## DHCP Snooping Entry

This window is used to view dynamic entries on specific ports.

To view this window, click **Security > IP-MAC-Port Binding (IMPB) > DHCP Snooping > DHCP Snooping Entry** as shown below:

IP Address	MAC Address	Lease Time (sec)	Port	Status
------------	-------------	------------------	------	--------

Figure 8-30 DHCP Snooping Entry window

The fields that can be configured are described below:

Parameter	Description
-----------	-------------

<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Use the drop-down menu to select the desired port.
<b>Ports</b>	Specify the ports for DHCP snooping entries. Tick the <b>All Ports</b> check box to select all entries for all ports. Tick the <b>IPv4</b> check box to select IPv4 DHCP snooping learned entries. Tick the <b>IPv6</b> check box to select IPv6 DHCP snooping learned entries..

Click the **Find** button to locate a specific entry based on the port number selected.

Click the **Clear** button to clear all the information entered in the fields.

Click the **View All** button to display all the existing entries.

## ND Snooping

### ND Snooping Maximum Entry Settings

Users can configure the maximum ND Snooping entry for ports on this page.

To view this window, click **Security > IP-MAC-Port Binding (IMPB) > ND Snooping > ND Snooping Maximum Entry Settings** as shown below:

Port	Maximum Entry
1	No Limit
2	No Limit
3	No Limit
4	No Limit
5	No Limit
6	No Limit
7	No Limit
8	No Limit
9	No Limit
10	No Limit
11	No Limit
12	No Limit

Figure 8-31 ND Snooping Maximum Entry Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menus to select a range of ports that require a restriction on the maximum number of entries that can be learned with ND snooping.
<b>Maximum Entry (1-50)</b>	Enter the maximum entry value. Tick the <b>No Limit</b> check box to have unlimited maximum number of the learned entries.

Click the **Apply** button to accept the changes made.

## ND Snooping Entry

This window is used to view dynamic entries on specific ports.

To view this window, click **Security > IP-MAC-Port Binding (IMPB) > ND Snooping > ND Snooping Entry** as shown below:

The screenshot shows the 'ND Snooping Entry' window. At the top, there are dropdown menus for 'Unit' (set to 1) and 'Port' (set to 01), a 'Find' button, and a 'Clear' button. Below these are fields for specifying ports (e.g.: 1:4, 3:6-3:7) and a 'View All' button. A message 'Total Entries: 0' is displayed. The table header includes columns for IP Address, MAC Address, Lease Time (sec), Port, and Status.

IP Address	MAC Address	Lease Time (sec)	Port	Status
------------	-------------	------------------	------	--------

**Figure 8-32 ND Snooping Entry window**

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Use the drop-down menu to select the desired port.
<b>Ports</b>	Specify the ports for ND snooping entries. Tick the <b>All Ports</b> check box to select all entries for all ports.

Click the **Find** button to locate a specific entry based on the port number selected.

Click the **Clear** button to clear all the information entered in the fields.

Click the **View All** button to display all the existing entries.

## MAC-based Access Control (MAC)

MAC-based access control is a method to authenticate and authorize access using either a port or host. For port-based MAC-based access control, the method decides port access rights, while for host-based MAC-based access control, the method determines the MAC access rights.

A MAC user must be authenticated before being granted access to a network. Both local authentication and remote RADIUS server authentication methods are supported. In MAC-based access control, MAC user information in a local database or a RADIUS server database is searched for authentication. Following the authentication result, users achieve different levels of authorization.

### Notes about MAC-based Access Control

There are certain limitations and regulations regarding MAC-based access control:

- Once this feature is enabled for a port, the Switch will clear the FDB of that port.
- If a port is granted clearance for a MAC address in a VLAN that is not a Guest VLAN, other MAC addresses on that port must be authenticated for access and otherwise will be blocked by the Switch.
- Ports that have been enabled for Link Aggregation and Port Security cannot be enabled for MAC-based Authentication.
- Ports that have been enabled for GVRP cannot be enabled for Guest VLAN.

## MAC-based Access Control Settings

This window is used to set the parameters for the MAC-based access control function on the Switch. The user can set the running state, method of authentication, RADIUS password, view the Guest VLAN configuration to be associated with the MAC-based access control function of the Switch, and configure ports to be enabled or disabled for the MAC-based access control feature of the Switch. Please remember, ports enabled for certain other features, listed previously, and cannot be enabled for MAC-based access control.

To view this window, click **Security > MAC-based Access Control (MAC) > MAC-based Access Control Settings** as shown below:

**MAC-based Access Control Global Settings**

MAC-based Access Control State:  Enabled  Disabled Apply

Method	Local	Password Type	Manual String
RADIUS Authorization	Enabled	Password	default
Local Authorization	Enabled	Trap State	Enabled
Log State	Enabled	Max User (1-4000)	<input type="text" value="128"/> <input checked="" type="checkbox"/> No Limit <span style="float: right;">Apply</span>

**Guest VLAN Settings**

VLAN Name:  VID (1-4094):  Add Delete

Member Ports (e.g.: 1:1-1:5, 1:9):

**Port Settings**

Unit	From Port	To Port	State	Aging Time (1-1440)	Block Time (0-300)	Max User (1-4000)
1	01	01	Disabled	1440 min	300 sec	128 <input checked="" type="checkbox"/> No Limit <span style="float: right;">Apply</span>

Port	State	Aging Time (min)	Block Time (sec)	Max User
1	Disabled	1440	300	1024
2	Disabled	1440	300	1024
3	Disabled	1440	300	1024

Figure 8-33 MAC-based Access Control Settings window

The fields that can be configured are described below:

Parameter	Description
<b>MAC-based Access Control State</b>	Toggle to globally enable or disable the MAC-based access control function on the Switch.
<b>Method</b>	<p>Use this drop-down menu to choose the type of authentication to be used when authenticating MAC addresses on a given port. The user may choose between the following methods:</p> <p><b>Local</b> – Use this method to utilize the locally set MAC address database as the authenticator for MAC-based access control. This MAC address list can be configured in the MAC-based access control Local Database Settings window.</p> <p><b>RADIUS</b> – Use this method to utilize a remote RADIUS server as the authenticator for MAC-based access control. Remember, the MAC list must be previously set on the RADIUS server.</p>

<b>RADIUS Authorization</b>	Use the drop-down menu to enable or disable the use of RADIUS Authorization.
<b>Local Authorization</b>	Use the drop-down menu to enable or disable the use of Local Authorization.
<b>Log State</b>	Use the drop-down menu to enable or disable log state.
<b>Password Type</b>	Use the drop-down menu to select the password type. Available options are <i>Manual String</i> and <i>Client MAC Address</i> .
<b>Password</b>	Enter the password for the RADIUS server, which is to be used for packets being sent requesting authentication. The default password is “default”.
<b>Trap State</b>	Use the drop-down menu to enable or disable sending out the trap for MAC-based Access Control.
<b>Max User (1-4000)</b>	Enter the maximum amount of users of the Switch. Tick the <b>No Limit</b> check box to have unlimited users.
<b>VLAN Name</b>	Enter the name of the previously configured Guest VLAN being used for this function.
<b>VID</b>	Click the radio button and enter a Guest VLAN ID.
<b>Member Ports</b>	Enter the list of ports that have been configured for the Guest VLAN.
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menus to select a range of ports to be configured for MAC-based access control.
<b>State</b>	Use this drop-down menu to enable or disable MAC-based access control on the port or range of ports selected in the Port Settings section of this window.
<b>Aging Time (1-1440)</b>	Enter a value between 1 and 1440 minutes. The default is 1440. To set this value to have no aging time, select the <b>Infinite</b> option.
<b>Block Time (0-300)</b>	Enter a value between 0 and 300 seconds. The default is 300.
<b>Max User (1-4000)</b>	Enter the maximum user used for this configuration. When <b>No Limit</b> is selected, there will be no user limit applied to this rule.

Click the **Apply** button to accept the changes made for each individual section.

## MAC-based Access Control Local Settings

Users can set a list of MAC addresses, along with their corresponding target VLAN, which will be authenticated for the Switch. Once a queried MAC address is matched in this window, it will be placed in the VLAN associated with it here. The Switch administrator may enter up to 1024 MAC addresses to be authenticated using the local method configured here.

To view this window, click **Security > MAC-based Access Control (MAC) > MAC-based Access Control Local Settings** as shown below:

The screenshot shows the 'MAC-based Access Control Local Settings' window. At the top, there are input fields for 'MAC Address' (00-11-22-33-44-55), 'VLAN Name' (v2), and 'VID (1-4094)' (2). Below these are buttons for 'Add', 'Delete by MAC', 'Delete by VLAN', 'Find by MAC', 'Find by VLAN', and 'View All'. A message 'Total Entries: 1' is displayed above a table. The table has columns for 'MAC Address', 'VLAN Name', and 'VID'. One row is shown with values: MAC Address 00-11-22-33-44-55, VLAN Name v2, VID 2. Buttons for 'Edit by Name' and 'Edit by ID' are also present. At the bottom right are page navigation buttons '1/1' and '1'.

Figure 8-34 MAC-based Access Control Local Settings window

The fields that can be configured are described below:

Parameter	Description
<b>MAC address</b>	Enter the MAC address that will be added to the local authentication list here.
<b>VLAN Name</b>	Enter the VLAN name of the corresponding MAC address here.
<b>VID (1-4094)</b>	Enter the VLAN ID of the corresponding MAC address here.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete by MAC** button to remove the specific entry based on the MAC address entered.

Click the **Delete by VLAN** button to remove the specific entry based on the VLAN name or ID entered.

Click the **Find by MAC** button to locate a specific entry based on the MAC address entered.

Click the **Find by VLAN** button to locate a specific entry based on the VLAN name or ID entered.

Click the **View All** button to display all the existing entries.

Click the **Edit by Name** button to change the specific MAC address' VLAN name.

Click the **Edit by ID** button to change the specific MAC address' VLAN ID.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

## MAC-based Access Control Authentication State

This window displays MAC-based access control Authentication State information.

To view this window, click **Security > MAC-based Access Control (MAC) > MAC-based Access Control Authentication State** as shown below:

The screenshot shows the 'MAC-based Access Control Authentication State' window. At the top, there is a field 'Port List (e.g.: 1:1, 1:5-1:10)' with a 'Find' and 'Clear by Port' button. Below this are 'View All Hosts' and 'Clear All Hosts' buttons. Statistics are listed: Total Authenticating Hosts: 0, Total Authenticated Hosts: 0, Total Blocked Hosts: 0. A table follows with columns: Port, MAC Address, Original RX VID, State, VID, Priority, Aging Time / Block Time. The table is currently empty.

Figure 8-35 MAC-based Access Control Authentication State window

The fields that can be configured are described below:

Parameter	Description
<b>Port List</b>	Enter a list of ports.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Clear by Port** button to clear all the information linked to the port number entered.

Click the **View All Hosts** button to display all the existing hosts.

Click the **Clear All hosts** button to clear out all the existing hosts.

## Web-based Access Control (WAC)

Web-based Authentication Login is a feature designed to authenticate a user when the user is trying to access the Internet via the Switch. The authentication process uses the HTTP or HTTPS protocol. The Switch enters the authenticating stage when users attempt to browse Web pages (e.g., <http://www.dlink.com>) through a Web browser. When the Switch detects HTTP or HTTPS packets and this port is un-authenticated, the Switch will launch a pop-up user name and password window to query users. Users are not able to access the Internet until the authentication process is passed.

The Switch can be the authentication server itself and do the authentication based on a local database, or be a RADIUS client and perform the authentication process via the RADIUS protocol with a remote RADIUS server. The client user initiates the authentication process of WAC by attempting to gain Web access.

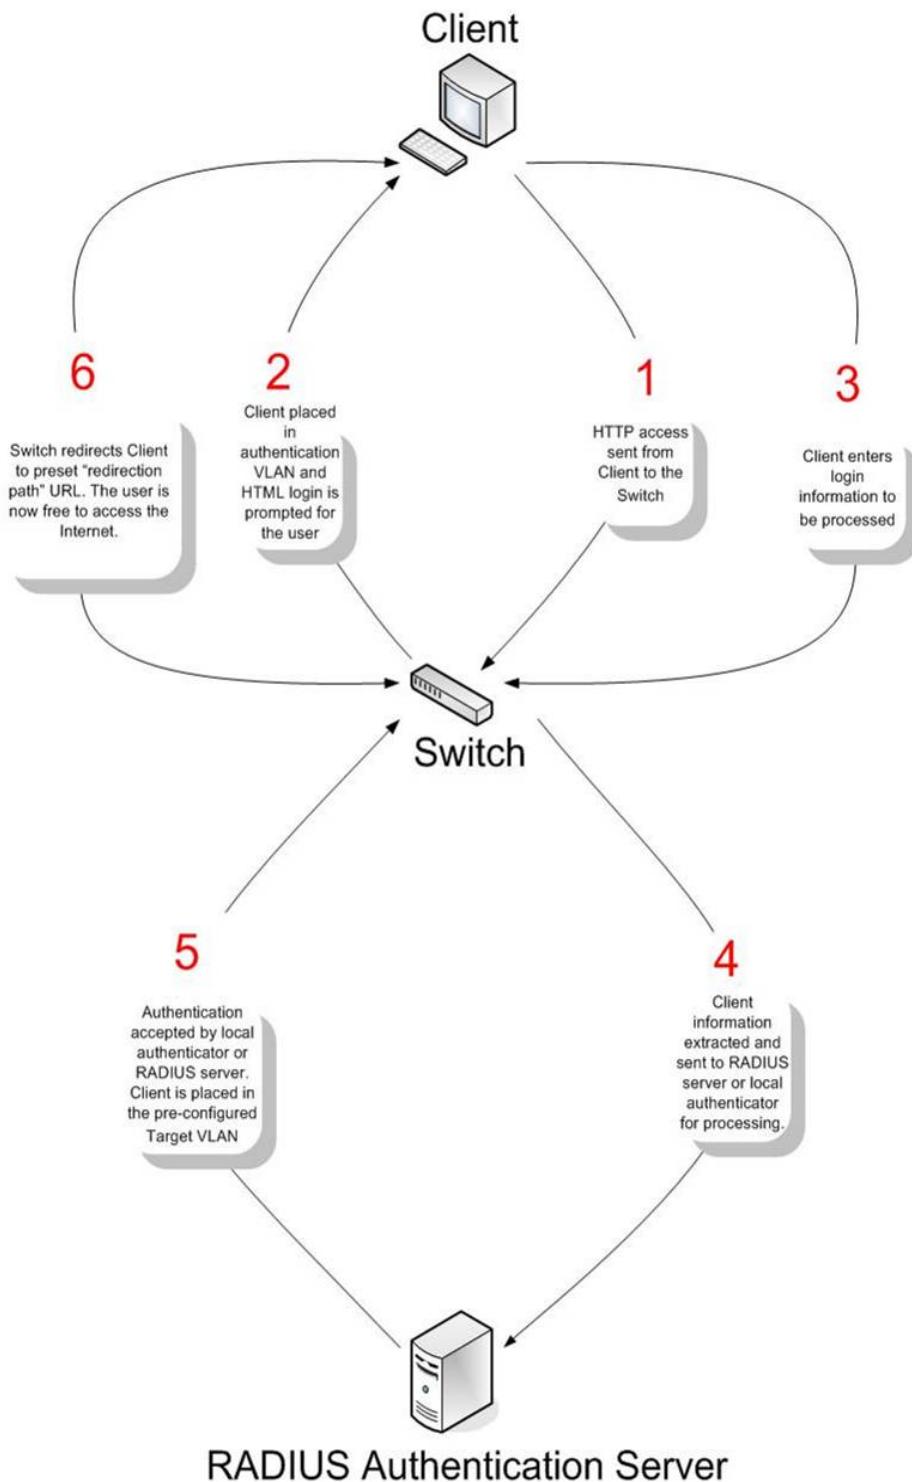

D-Link's implementation of WAC uses a virtual IP that is exclusively used by the WAC function and is not known by any other modules of the Switch. In fact, to avoid affecting a Switch's other features, WAC will only use a virtual IP address to communicate with hosts. Thus, all authentication requests must be sent to a virtual IP address but not to the IP address of the Switch's physical interface.

Virtual IP works like this, when a host PC communicates with the WAC Switch through a virtual IP, the virtual IP is transformed into the physical IPIF (IP interface) address of the Switch to make the communication possible. The host PC and other servers' IP configurations do not depend on the virtual IP of WAC. The virtual IP does not respond to any ICMP packets or ARP requests, which means it is not allowed to configure a virtual IP on the same subnet as the Switch's IPIF (IP interface) or the same subnet as the host PCs' subnet.

As all packets to a virtual IP from authenticated and authenticating hosts will be trapped to the Switch's CPU, if the virtual IP is the same as other servers or PCs, the hosts on the WAC-enabled ports cannot communicate with the server or PC which really own the IP address. If the hosts need to access the server or PC, the virtual IP cannot be the same as the one of the server or PC. If a host PC uses a proxy to access the Web, to make the authentication work properly the user of the PC should add the virtual IP to the exception of the proxy configuration. Whether or not a virtual IP is specified, users can access the WAC pages through the Switch's system IP. When a virtual IP is not specified, the authenticating Web request will be redirected to the Switch's system IP.

The Switch's implementation of WAC features a user-defined port number that allows the configuration of the TCP port for either the HTTP or HTTPS protocols. This TCP port for HTTP or HTTPS is used to identify the HTTP or HTTPS packets that will be trapped to the CPU for authentication processing, or to access the login page. If not specified, the default port number for HTTP is 80 and the default port number for HTTPS is 443. If no protocol is specified, the default protocol is HTTP.

The following diagram illustrates the basic six steps all parties go through in a successful Web Authentication process:

### Conditions and Limitations

1. If the client is utilizing DHCP to attain an IP address, the authentication VLAN must provide a DHCP server or a DHCP relay function so that client may obtain an IP address.
2. Certain functions exist on the Switch that will filter HTTP packets, such as the Access Profile function. The user needs to be very careful when setting filter functions for the target VLAN, so that these HTTP packets are not denied by the Switch.
3. If a RADIUS server is to be used for authentication, the user must first establish a RADIUS Server with the appropriate parameters, including the target VLAN, before enabling Web Authentication on the Switch.

## WAC Global Settings

Users can configure the Switch for the Web-based access control function.

To view this window, click **Security > Web-based Access Control (WAC) > WAC Global Settings** as shown below:

The screenshot shows the 'WAC Global Settings' window. At the top left is the title 'WAC Global Settings'. To the right is a 'Safeguard' button. Below the title, there's a section for 'WAC Global State' with radio buttons for 'Enabled' (selected) and 'Disabled'. An 'Apply' button is to the right. The main area is titled 'WAC Settings' and contains the following fields:

- Virtual IP:** Text input field containing '0.0.0.0'.
- Redirection Path:** Text input field.
- RADIUS Authorization:** Drop-down menu set to 'Enabled'.
- Method:** Drop-down menu set to 'Local'.
- Virtual IPv6:** Text input field containing '::'.
- Clear Redirection Path:** Radio buttons for 'Yes' (selected) and 'No'.
- Local Authorization:** Drop-down menu set to 'Enabled'.
- HTTP(S) Port (1-65535):** Text input field containing '80'.
- Protocol:** Radio buttons for 'HTTP' (selected) and 'HTTPS'.

At the bottom right of the window is another 'Apply' button.

Figure 8-36 WAC Global Settings window

The fields that can be configured are described below:

Parameter	Description
<b>WAC Global State</b>	Use this selection menu to either enable or disable the Web Authentication on the Switch.
<b>Virtual IP</b>	Enter a virtual IP address. This address is only used by WAC and is not known by any other modules of the Switch.
<b>Virtual IPv6</b>	Enter a virtual IPv6 address. This address is only used by WAC and is not known by any other modules of the Switch.
<b>Redirection Path</b>	Enter the URL of the website that authenticated users placed in the VLAN are directed to once authenticated.
<b>Clear Redirection Path</b>	The user can enable or disable this option to clear the redirection path.
<b>RADIUS Authorization</b>	The user can enable or disable this option to enable RADIUS Authorization or not.
<b>Local Authorization</b>	The user can enable or disable this option to enable Local Authorization or not.
<b>Method</b>	<p>Use this drop-down menu to choose the authenticator for Web-based Access Control. The user may choose:</p> <p><i>Local</i> – Choose this parameter to use the local authentication method of the Switch as the authenticating method for users trying to access the network via the switch. This is, in fact, the username and password to access the Switch configured using the WAC User Settings window seen below.</p> <p><i>RADIUS</i> – Choose this parameter to use a remote RADIUS server as the authenticating method for users trying to access the network via the switch. This RADIUS server must have already been pre-assigned by the administrator using the Authentication RADIUS Server Settings window.</p>
<b>HTTP(S) Port (1-65535)</b>	<p>Enter a HTTP port number. Port 80 is the default.</p> <p><i>HTTP</i> – Specifies that the TCP port will run the WAC HTTP protocol. The default value is 80. HTTP port cannot run at TCP port 443.</p> <p><i>HTTPS</i> – Specifies that the TCP port will run the WAC HTTPS protocol. The default value is 443. HTTPS cannot run at TCP port 80.</p>

Click the **Apply** button to accept the changes made for each individual section.

**NOTE:** A successful authentication should direct the client to the stated web page. If the client does not reach this web page, yet does not receive a **Fail!** Message, the client will already be authenticated and therefore should refresh the current browser window or attempt to open a different web page.

## WAC User Settings

Users can view and set local database user accounts for Web authentication.

To view this window, click **Security > Web-based Access Control (WAC) > WAC User Settings** as shown below:

The screenshot shows the 'WAC User Settings' window. At the top, there's a 'Create User' section with fields for 'User Name' (radio buttons for 'VLAN Name' and 'VID (1-4094)'), 'Password', and 'Confirm Password'. Below this is a note: 'Note: WAC User and Password should be less than 16 characters.' A table titled 'Total Entries: 1' lists one entry: 'WACUser2' with 'VLAN Name' '2' and 'Old Password' '\*\*\*\*\*'. To the right of the table are buttons for 'Edit VLAN Name', 'Edit VID', 'Clear VLAN', and 'Delete'. At the bottom right are 'Apply' and 'Delete All' buttons.

Figure 8-37 WAC User Settings window

The fields that can be configured are described below:

Parameter	Description
User Name	Enter the user name of up to 15 alphanumeric characters of the guest wishing to access the Web through this process. This field is for administrators who have selected <i>Local</i> as their Web-based authenticator.
VLAN Name	Click the button and enter a VLAN Name in this field.
VID (1-4094)	Click the button and enter a VID in this field.
Password	Enter the password the administrator has chosen for the selected user. This field is case-sensitive and must be a complete alphanumeric string. This field is for administrators who have selected <i>Local</i> as their Web-based authenticator.
Confirm Password	Retype the password entered in the previous field.

Click the **Apply** button to accept the changes made.

Click the **Delete All** button to remove all the entries listed.

Click the **Edit VLAN Name** button to re-configure the specific entry's VLAN Name.

Click the **Edit VID** button to re-configure the specific entry's VLAN ID.

Click the **Clear VLAN** button to remove the VLAN information from the specific entry.

Click the **Delete** button to remove the specific entry.

## WAC Port Settings

Users can view and set port configurations for Web authentication.

To view this window, click **Security > Web-based Access Control (WAC) > WAC Port Settings** as shown below:

The WAC Port Settings window allows you to configure WAC port settings for a specific unit and port range. The configuration includes Aging Time, Idle Time, State, and Block Time parameters. An 'Apply' button is used to save changes, and a 'Safeguard' radio button is present.

Port	State	Aging Time	Idle Time	Block Time
1	Disabled	1440	Infinite	60
2	Disabled	1440	Infinite	60
3	Disabled	1440	Infinite	60
4	Disabled	1440	Infinite	60
5	Disabled	1440	Infinite	60
6	Disabled	1440	Infinite	60
7	Disabled	1440	Infinite	60
8	Disabled	1440	Infinite	60

Figure 8-38 WAC Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menus to select a range of ports to be enabled as WAC ports.
<b>Aging Time (1-1440)</b>	This parameter specifies the time period during which an authenticated host will remain in the authenticated state. Enter a value between 1 and 1440 minutes. Tick the <b>Infinite</b> check box to indicate the authenticated host will never age out on the port. The default value is 1440 minutes (24 hours).
<b>State</b>	Use this drop-down menu to enable the configured ports as WAC ports.
<b>Idle Time (1-1440)</b>	If there is no traffic during the Idle Time parameter, the host will be moved back to the unauthenticated state. Enter a value between 1 and 1440 minutes. Tick the <b>Infinite</b> check box to indicate the Idle state of the authenticated host on the port will never be checked. The default value is Infinite.
<b>Block Time (0-300)</b>	This parameter is the period of time a host will be blocked if it fails to pass authentication. Enter a value between 0 and 300 seconds. The default value is 60 seconds.

Click the **Apply** button to accept the changes made.

## WAC Authentication State

Users can view and delete the hosts for Web authentication.

To view this window, click **Security > Web-based Access Control (WAC) > WAC Authentication State** as shown below:

The screenshot shows the 'WAC Authentication State' window. At the top, there are two input fields for 'Port List' (e.g., 1:1, 1:5-1:10) and three checkboxes: 'Authenticated' (checked), 'Authenticating' (checked), and 'Blocked' (checked). To the right are 'Find' and 'Clear by Port' buttons. Below these are 'View All Hosts' and 'Clear All Hosts' buttons. A summary section displays 'Total Authenticating Hosts: 0', 'Total Authenticated Hosts: 0', and 'Total Blocked Hosts: 0'. The main table has a header row with columns: Port, MAC Address, Original RX VID, State, VID, Assigned Priority, Aging Time / Block Time, and Idle Time.

Figure 8-39 WAC Authentication State window

The fields that can be configured are described below:

Parameter	Description
<b>Port List</b>	Enter a port or range of ports, and tick the appropriate check box(s), Authenticated, Authenticating, and Blocked.
<b>Authenticated</b>	Tick this check box to clear all authenticated users for a port.
<b>Authenticating</b>	Tick this check box to clear all authenticating users for a port.
<b>Blocked</b>	Tick this check box to clear all blocked users for a port.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Clear by Port** button to remove entry based on the port list entered.

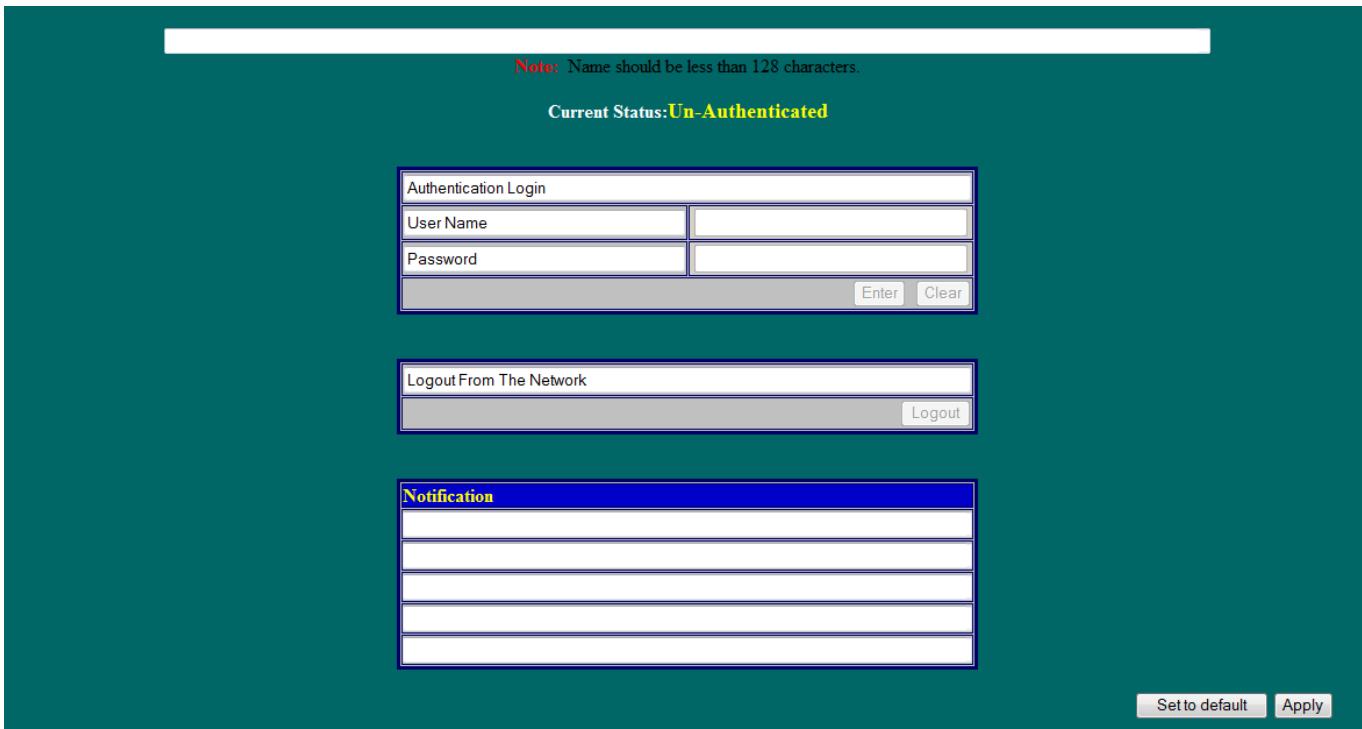

Click the **View All Hosts** button to display all the existing entries.

Click the **Clear All Hosts** button to remove all the entries listed.

## WAC Customize Page

This window is used to customize the authenticate page elements.

To view this window, click **Security > Web-based Access Control (WAC) > WAC Customize Page** as shown below:

**Figure 8-40 WAC Customize Page window**

Complete the WAC authentication information on this window to set the WAC page settings. Click the **Apply** button to implement the changes made. Click the **Set to default** button to go back to the default settings of all elements. Click the **Edit** button to re-configure the elements.

## Japanese Web-based Access Control (JWAC)

### JWAC Global Settings

This window is used to enable and configure Japanese Web-based Access Control on the Switch. JWAC and Web Authentication are mutually exclusive functions. That is, they cannot be enabled at the same time. To use the JWAC feature, computer users need to pass through two stages of authentication. The first stage is to do the authentication with the quarantine server and the second stage is the authentication with the Switch. For the second stage, the authentication is similar to Web Authentication, except that there is no port VLAN membership change by JWAC after a host passes authentication. JWAC and WAC can share the same RADIUS server.

To view this window, click **Security > Japanese Web-based Access Control (JWAC) > JWAC Global Settings** as shown below:

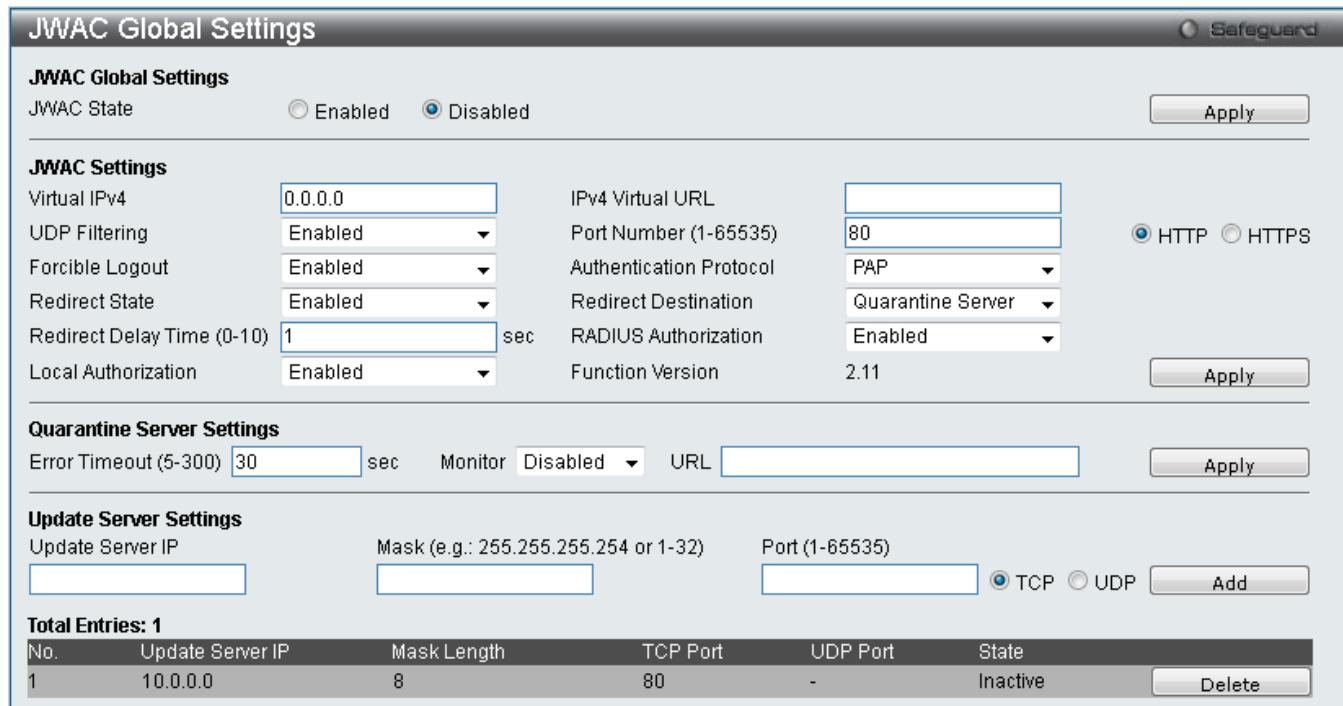

Figure 8-41 JWAC Global Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>JWAC State</b>	Click the radio buttons to enable or disable JWAC on the Switch.
<b>Virtual IPv4</b>	Enter the JWAC Virtual IP address that is used to accept authentication requests from an unauthenticated host. The Virtual IP address of JWAC is used to accept authentication requests from an unauthenticated host. Only requests sent to this IP will get a correct response. <b>NOTE:</b> This IP does not respond to ARP requests or ICMP packets.
<b>IPv4 Virtual URL</b>	Enter the Virtual URL used.
<b>UDP Filtering</b>	Use the drop-down menu to enable or disable JWAC UDP Filtering. When UDP Filtering is <i>Enabled</i> , all UDP and ICMP packets except DHCP and DNS packets from unauthenticated hosts will be dropped. A ping packet will pass through when the JWAC authenticating time is between 0 and 30.
<b>Port Number (1-65535)</b>	Enter the TCP port that the JWAC Switch listens to and uses to finish the authenticating process.
<b>Forcible Logout</b>	Use the drop-down menu to enable or disable JWAC Forcible Logout. When Forcible Logout is <i>Enabled</i> , a Ping packet from an authenticated host to the JWAC Switch with TTL=1 will be regarded as a logout request, and the host will move back to the unauthenticated state.
<b>Authentication Protocol</b>	Use the drop-down menu to choose the RADIUS protocol used by JWAC to complete a RADIUS authentication. The options include <i>Local</i> , <i>EAP MD5</i> , <i>PAP</i> , <i>CHAP</i> , <i>MS CHAP</i> , and <i>MS CHAPv2</i> .
<b>Redirect State</b>	Use the drop-down menu to enable or disable JWAC Redirect. When the redirect quarantine server is enabled, the unauthenticated host will be redirected to the quarantine server when it tries to access a random URL. When the redirect JWAC login

	page is enabled, the unauthenticated host will be redirected to the JWAC login page in the Switch to finish authentication. When redirect is disabled, only access to the quarantine server and the JWAC login page from the unauthenticated host are allowed, all other web access will be denied. <b>NOTE:</b> When enabling redirect to the quarantine server, a quarantine server must be configured first.
<b>Redirect Destination</b>	Use the drop-down menu to select the destination before an unauthenticated host is redirected to either the <i>Quarantine Server</i> or the <i>JWAC Login Page</i> .
<b>Redirect Delay Time (0-10)</b>	Enter the Delay Time before an unauthenticated host is redirected to the Quarantine Server or JWAC Login Page. Enter a value between 0 and 10 seconds. A value of 0 indicates no delay in the redirect.
<b>RADIUS Authorization</b>	Use the drop-down menu to enable or disable RADIUS Authorization.
<b>Local Authorization</b>	Use the drop-down menu to enable or disable Local Authorization.
<b>Error Timeout (5-300)</b>	Enter the time in second for the Quarantine Server Error Timeout. When the Quarantine Server Monitor is enabled, the JWAC Switch will periodically check if the Quarantine works okay. If the Switch does not receive any response from the Quarantine Server during the configured Error Timeout, the Switch then regards it as not working properly. Enter a value between 5 and 300 seconds.
<b>Monitor</b>	Use the drop-down menu to enable or disable the JWAC Quarantine Server Monitor. When <i>Enabled</i> , the JWAC Switch will monitor the Quarantine Server to ensure the server is okay. If the Switch detects no Quarantine Server, it will redirect all unauthenticated HTTP access attempts to the JWAC Login Page forcibly if the Redirect is enabled and the Redirect Destination is configured to be a Quarantine Server.
<b>URL</b>	Enter the JWAC Quarantine Server URL. If the Redirect is enabled and the Redirect Destination is the Quarantine Server, when an unauthenticated host sends the HTTP request packets to a random Web server, the Switch will handle this HTTP packet and send back a message to the host to allow it access to the Quarantine Server with the configured URL. When a computer is connected to the specified URL, the quarantine server will request the computer user to input the user name and password to complete the authentication process.
<b>Update Server IP</b>	Enter the Update Server IP address.
<b>Mask</b>	Enter the Server IP net mask.
<b>Port (1-65535)</b>	Enter the port number used by the Update Server. Tick the <b>TCP</b> or <b>UDP</b> options to specifies that this port uses the TCP or UDP protocol.

Click the **Apply** button to accept the changes made for each individual section.

## JWAC Port Settings

This window is used to configure JWAC port settings for the Switch.

To view this window, click **Security > Japanese Web-based Access Control (JWAC) > JWAC Port Settings** as shown below:

The screenshot shows the 'JWAC Port Settings' window. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), 'To Port' (set to 01), and 'State' (set to 'Disabled'). Below these are input fields for 'Aging Time (1-1440)' (set to 1440 min, with 'Infinite' checked) and 'Block Time (0-300)' (set to 60 sec). There is also an 'Idle Time (1-1440)' field which is currently empty. An 'Apply' button is located at the bottom right. Below the configuration area is a table listing port settings for ports 1 through 10. The table columns are 'Port', 'State', 'Aging Time', 'Idle Time', 'Block Time', and 'Max Host'. All ports are set to 'Disabled', '1440', 'Infinite', '60', and '100' respectively.

Port	State	Aging Time	Idle Time	Block Time	Max Host
1	Disabled	1440	Infinite	60	100
2	Disabled	1440	Infinite	60	100
3	Disabled	1440	Infinite	60	100
4	Disabled	1440	Infinite	60	100
5	Disabled	1440	Infinite	60	100
6	Disabled	1440	Infinite	60	100
7	Disabled	1440	Infinite	60	100
8	Disabled	1440	Infinite	60	100
9	Disabled	1440	Infinite	60	100
10	Disabled	1440	Infinite	60	100

Figure 8-42 JWAC Port Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menus to select a range of ports to be enabled as JWAC ports.
<b>State</b>	Use this drop-down menu to enable the configured ports as JWAC ports.
<b>Max Authenticating Host (0-100)</b>	Enter the maximum number of host process authentication attempts allowed on each port at the same time. The default value is 100.
<b>Aging Time (1-1440)</b>	Enter the time period during which an authenticated host will remain in the authenticated state. Tick the <b>Infinite</b> check box to never age out the authenticated host on the port. The default value is 1440.
<b>Block Time (0-300)</b>	Enter the period of time that a host will be blocked if it fails to pass authentication. The default value is 60.
<b>Idle Time (1-1440)</b>	If there is no traffic during the Idle Time parameter, the host will be moved back to the unauthenticated state. The default value is Infinite. To change this value, un-tick the <b>Infinite</b> check box and enter a value between 1 and 1440 minute(s). Tick the <b>Infinite</b> check box to indicate the Idle state of the authenticated host on the port will never be checked.

Click the **Apply** button to accept the changes made.

## JWAC User Settings

This window is used to configure a JWAC user of the switch's local database.

To view this window, click **Security > Japanese Web-based Access Control (JWAC) > JWAC User Settings** as shown below:

The screenshot shows the 'JWAC User Settings' window. At the top, there are input fields for 'User Name' (containing 'JWACUser'), 'Password' (containing '\*\*\*\*\*'), and 'Confirm Password' (containing '\*\*\*\*\*'). Below these is a note: 'Note: Password / User Name should be no more than 15 characters.' To the right are 'Add' and 'Delete All' buttons. A summary section at the bottom left says 'Total Entries: 1' and lists the entry: 'User Name: JWACUser, VID: 1, Password: \*\*\*\*\*, Confirm Password: \*\*\*\*\*'. To the right of this list are 'Edit' and 'Delete' buttons.

**Figure 8-43 JWAC User Settings Window**

The fields that can be configured are described below:

Parameter	Description
User Name	Enter a username of up to 15 alphanumeric characters.
Password	Enter the password the administrator has chosen for the selected user. This field is case-sensitive and must be a complete alphanumeric string.
Confirm Password	Retype the password entered in the previous field.
VID(1-4094)	Enter a VLAN ID number between 1 and 4094.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

**NOTE:** The **Username** and **Password** values should be less than 16 characters.

## JWAC Authentication State

This window is used to display Japanese Web-based Access Control Host Table information.

To view this window, click **Security > Japanese Web-based Access Control (JWAC) > JWAC Authentication State** as shown below:

The screenshot shows the 'JWAC Authentication State' window. At the top, there are two input fields for 'Port List (e.g.: 1:1, 1:5-1:10)' with a 'Find' button to the right. Below these are three check boxes: 'Authenticated', 'Authenticating', and 'Blocked'. To the right of these are 'Clear' and 'View All Hosts' buttons. Below this section, statistics are displayed: 'Total Authenticating Hosts: 0', 'Total Authenticated Hosts: 0', and 'Total Blocked Hosts: 0'. At the bottom, a table header is shown with columns: Port, MAC Address, User, IP, State, VID, Priority, and Time.

**Figure 8-44 JWAC Authentication State Window**

The fields that can be configured are described below:

Parameter	Description
<b>Port List</b>	Enter a port or range of ports.
<b>Authenticated</b>	Tick this check box to only clear authenticated client hosts.
<b>Authenticating</b>	Tick this check box to only clear client hosts in the authenticating process.
<b>Blocked</b>	Tick this check box to only clear client hosts being temporarily blocked because of the failure of authentication.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Clear** button to remove entry based on the port list entered.

Click the **View All Hosts** button to display all the existing entries.

Click the **Clear All Hosts** button to remove all the entries listed.

## JWAC Customize Page Language

Users can configure JWAC page and language settings for the Switch. The current firmware supports either English or Japanese.

To view this window, click **Security > Japanese Web-based Access Control (JWAC) > JWAC Customize Page Language** as shown below:

The screenshot shows the 'JWAC Customize Page Language' window. It features a radio button group for 'Customize Page Language' with options for 'English' (selected) and 'Japanese'. At the bottom right is an 'Apply' button.

**Figure 8-45 JWAC Customize Page Language Window**

The fields that can be configured are described below:

Parameter	Description
<b>Customize Page Language</b>	Click the radio buttons to select English or Japanese.

Click the **Apply** button to accept the changes made.

## JWAC Customize Page

This window is used to configure JWAC page settings for the Switch.

To view this window, click **Security > Japanese Web-based Access Control (JWAC) > JWAC Customize Page** as shown below:

The screenshot shows the JWAC Customize Page interface. At the top left, there are links for "English" and "Japanese". Below this is a large empty white area with a thin black border. In the center, the text "Current Status: Un-Authenticated" is displayed in yellow. Below this is a "Authentication Login" section with fields for "User Name" and "Password", and buttons for "Enter" and "Clear". Further down is a "Logout From The Netw" section with a single "Logout" button. At the bottom is a "Notification" section containing five empty lines. At the very bottom right are two buttons: "Set to default" and "Apply".

Figure 8-46 English JWAC Login Window

[English](#) [Japanese](#)

The screenshot shows a Japanese JWAC login window with three main sections:

- Authentication Panel:** A blue header bar labeled "社内LAN認証ログイン". Below it are two input fields: "ユーザID" and "パスワード", each with a corresponding password mask. To the right of the fields are "Enter" and "Clear" buttons.
- Logout Panel:** A blue header bar labeled "社内LAN認証ログアウト". It contains a single "Logout" button.
- Notification Panel:** A blue header bar labeled "Notification". It displays five empty horizontal lines for notifications.

At the bottom right of the window are "Set to default" and "Apply" buttons.

Figure 8-47 Japanese JWAC Login Window

Complete the JWAC authentication information on this window to set the JWAC page settings. Enter a name for the Authentication in the first field and then click the **Apply** button. Next, enter a User Name and a Password and then click the **Enter** button.

## Compound Authentication

Compound Authentication settings allows for multiple authentication to be supported on the Switch.

### Compound Authentication Settings

This window is used to configure Authorization Network State Settings and compound authentication methods for a port or ports on the Switch.

To view this window, click **Security > Compound Authentication > Compound Authentication Settings** as shown below:

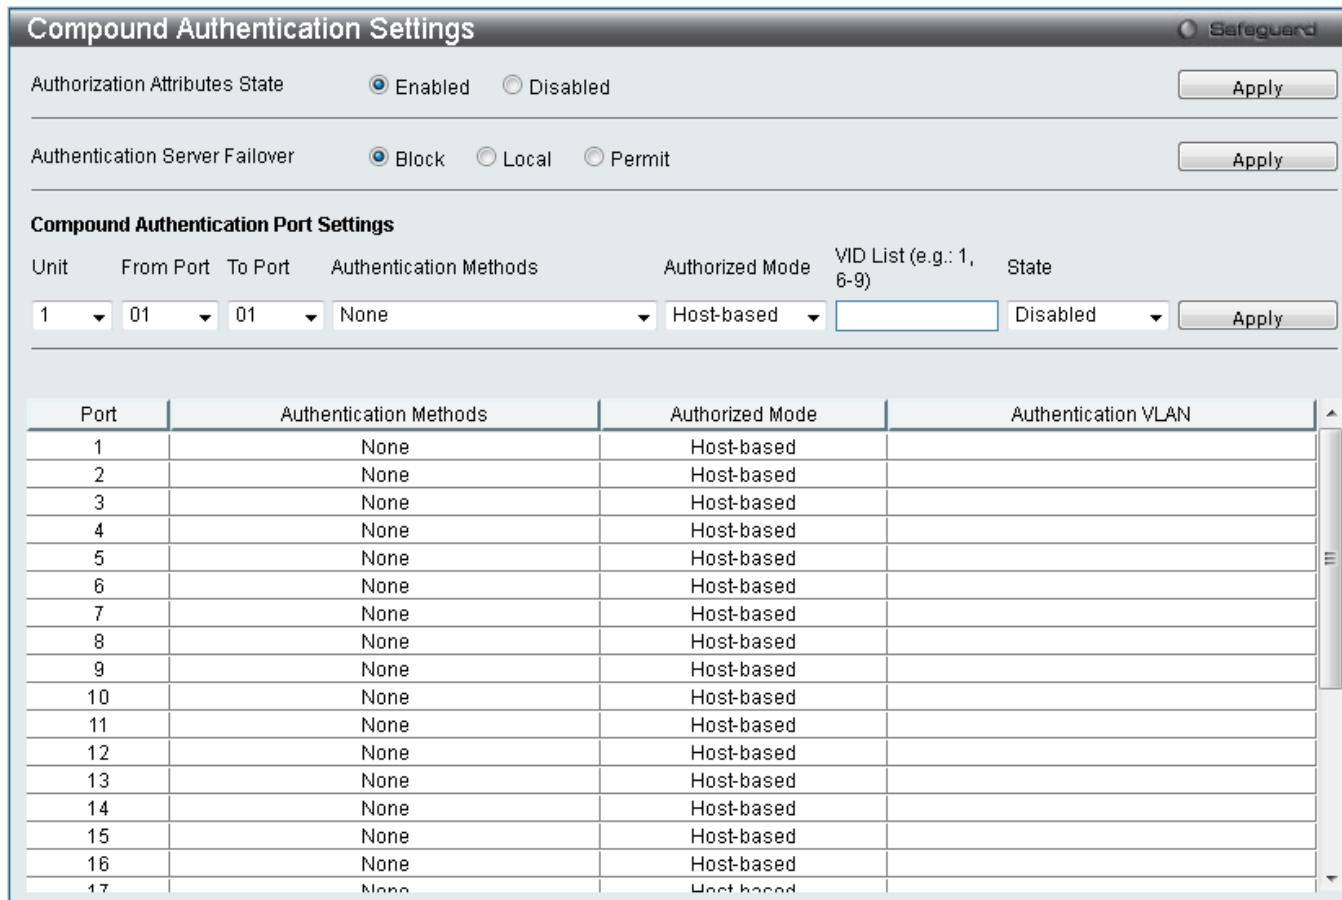

Figure 8-48 Compound Authentication Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Authorization Attributes State</b>	Click the radio buttons to enable or disable the Authorization Attributes State.
<b>Authentication Server Failover</b>	Click the radio buttons to configure the authentication server failover function. <b>Block</b> (default setting) - The client is always regarded as un-authenticated. <b>Local</b> - The switch will resort to using the local database to authenticate the client. If the client fails on local authentication, the client is regarded as un-authenticated, otherwise, it is authenticated. <b>Permit</b> - The client is always regarded as authenticated. If guest VLAN is enabled, clients will stay on the guest VLAN, otherwise, they will stay on the original VLAN.
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menus to select a range of ports to be enabled as compound authentication ports.
<b>Authentication Methods</b>	The compound authentication method options include: <i>None</i> , <i>Any (MAC, 802.1X, JWAC or WAC)</i> , <i>802.1X+IMPB</i> , <i>IMPB+JWAC</i> , <i>IMPB+WAC</i> , and <i>MAC+IMPB</i> . <i>None</i> - all compound authentication methods are disabled. <i>Any (MAC, 802.1X, JWAC or WAC)</i> - if any of the authentication methods pass, then access will be granted. In this mode, MAC, 802.1X, JWAC and WAC can be enabled on a port at the same time. In <i>Any (MAC, 802.1X, JWAC or WAC)</i>

	<p>mode, whether an individual security module is active on a port depends on its system state.</p> <p><i>802.1X+IMPB</i> - 802.1X will be verified first, and then IMPB will be verified. Both authentication methods need to be passed.</p> <p><i>IMPB+JWAC</i> – JWAC will be verified first, and then IMPB will be verified. Both authentication methods need to be passed.</p> <p><i>IMPB+WAC</i> - WAC will be verified first, and then IMPB will be verified. Both authentication methods need to be passed.</p> <p><i>MAC+IMPB</i> - MAC will be verified first, and then IMPB will be verified. Both authentication methods need to be passed.</p>
<b>Authorized Mode</b>	Toggle between <i>Host-based</i> and <i>Port-based</i> . When <i>Port-based</i> is selected, if one of the attached hosts passes the authentication, all hosts on the same port will be granted access to the network. If the user fails the authorization, this port will keep trying the next authentication method. When <i>Host-based</i> is selected, users are authenticated individually.
<b>VID List</b>	Enter a list of VLAN ID.
<b>State</b>	Use the drop-down menu to assign or remove the specified VID list as authentication VLAN(s).

Click the **Apply** button to accept the changes made for each individual section.

## Compound Authentication Guest VLAN Settings

This window is used to assign ports to or remove ports from a guest VLAN.

To view this window, click **Security > Compound Authentication > Compound Authentication Guest VLAN Settings** as shown below:

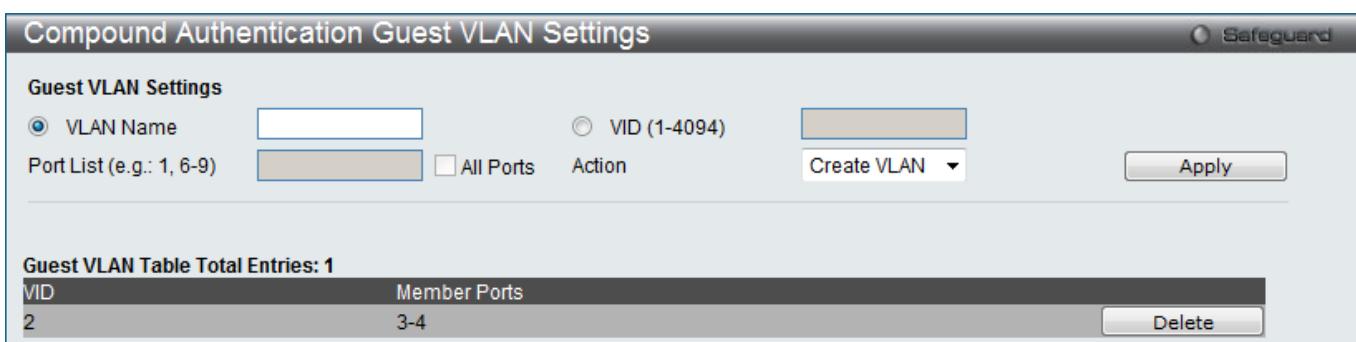

Figure 8-49 Compound Authentication Guest VLAN Settings window

The fields that can be configured are described below:

Parameter	Description
<b>VLAN Name</b>	Click the button and assign a VLAN as a Guest VLAN. The VLAN must be an existing static VLAN.
<b>VID (1-4094)</b>	Click the button and assign a VLAN ID for a Guest VLAN. The VLAN must be an existing static VLAN before this VID can be configured.
<b>Port List</b>	The list of ports to be configured. Alternatively, tick the <b>All Ports</b> check box to set every port at once.
<b>Action</b>	Use the drop-down menu to choose the desired operation: <i>Create VLAN</i> , <i>Add Ports</i> , or <i>Delete Ports</i> .

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry.

Once properly configured, the Guest VLAN and associated ports will be listed in the lower part of the window.

## Compound Authentication MAC Format Settings

This window is used to set the MAC address format that will be used for authentication username via the RADIUS server.

To view this window, click **Security > Compound Authentication > Compound Authentication MAC Format Settings** as shown below:

Compound Authentication MAC Format Settings	
Case	Uppercase
Delimiter	None
Delimiter Number	5
Apply	

**Figure 8-50 Compound Authentication MAC Format Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Case</b>	Use the drop-down menu to select the format for the RADIUS authentication username. <i>Lowercase</i> - Use lowercase format, the RADIUS authentication username will be formatted as: aa-bb-cc-dd-ee-ff. <i>Uppercase</i> - Use uppercase format, the RADIUS authentication username will be formatted as: AA-BB-CC-DD-EE-FF.
<b>Delimiter</b>	Use the drop-down menu to select the delimiter format. <i>Hyphen</i> - Use "-" as delimiter, the format is: AA-BB-CC-DD-EE-FF. <i>Colon</i> - Use ":" as delimiter, the format is: AA:BB:CC:DD:EE:FF. <i>Dot</i> - Use "." as delimiter, the format is: AA.BB.CC.DD.EE.FF. <i>None</i> – Do not use any delimiter, the format is: AABBCCDDEEFF.
<b>Delimiter Number</b>	Use the drop-down menu to select the delimiter number. 1 - Single delimiter, the format is: AABBCC.DDEEFF. 2 - Double delimiter, the format is: AABB.CCDD.EEFF. 5 - Multiple delimiter, the format is: AA.BB.CC.DD.EE.FF.

Click the **Apply** button to accept the changes made.

## IGMP Access Control Settings

Users can set IGMP authentication, otherwise known as IGMP access control, on individual ports on the Switch. When the **Authentication State** is **Enabled**, and the Switch receives an IGMP join request, the Switch will send the access request to the RADIUS server to do the authentication.

IGMP authentication processes IGMP reports as follows: When a host sends a join message for the interested multicast group, the Switch has to do authentication before learning the multicast group/port. The Switch sends an Access-Request to an authentication server and the information including host MAC, switch port number, switch IP, and multicast group IP. When the Access-Accept is answered from the authentication server, the Switch learns the

multicast group/port. When the Access-Reject is answered from the authentication server, the Switch won't learn the multicast group/port and won't process the packet further. The entry (host MAC, switch port number, and multicast group IP) is put in the "authentication failed list." When there is no answer from the authentication server after T1 time, the Switch resends the Access-Request to the server. If the Switch doesn't receive a response after N1 times, the result is denied and the entry (host MAC, switch port number, multicast group IP) is put in the "authentication failed list." In general case, when the multicast group/port is already learned by the switch, it won't do the authentication again. It only processes the packet as standard.

IGMP authentication processes IGMP leaves as follows: When the host sends leave message for the specific multicast group, the Switch follows the standard procedure for leaving a group and then sends an Accounting-Request to the accounting server for notification. If there is no answer from the accounting server after T2 time, the Switch resends the Accounting-Request to the server. The maximum number of retry times is N2.

To view this window, click **Security > IGMP Access Control Settings** as shown below:

Port	State
01	Disabled
02	Auth_accounting
03	Accounting_only
04	Auth_only
05	Disabled
06	Disabled

15	Disabled
16	Disabled
17	Disabled
18	Disabled
19	Disabled
20	Disabled
21	Disabled
22	Disabled
23	Disabled
24	Disabled

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you want to configure.
<b>From Port / To Port</b>	Use the drop-down menus to select a range of ports to be enabled as compound authentication ports.
<b>State</b>	Use the drop-down menu to configure the IGMP authentication status. If no parameter is chosen, Auth_accounting will be selected. This is for compatible application. <b>Disable</b> - Disables both the authentication and accounting function on the specified port. <b>Auth_accounting</b> - After the client authenticated, the accounting message will be sent to the RADIUS. <b>Auth_only</b> - After the client authenticated, the accounting message will not be sent to the RADIUS. <b>Accounting_only</b> - Authentication is not needed. If the client joins a group, the accounting message will be sent to the RADIUS.

Click the **Apply** button to accept the changes made.

# Port Security

## Port Security Settings

A given port's (or a range of ports') dynamic MAC address learning can be locked such that the current source MAC addresses entered into the MAC address forwarding table cannot be changed once the port lock is enabled. The port can be locked by changing the **Admin State** drop-down menu to *Enabled* and clicking **Apply**.

Port Security is a security feature that prevents unauthorized computers (with source MAC addresses) unknown to the Switch prior to locking the port (or ports) from connecting to the Switch's locked ports and gaining access to the network.

To view this window, click **Security > Port Security > Port Security Settings** as shown below:

The screenshot shows the 'Port Security Settings' configuration page. At the top, there are two sections: 'Port Security Trap Settings' and 'Port Security Log Settings'. Each section has two radio buttons: 'Enabled' (radioed) and 'Disabled'. Below these are 'Apply' buttons. In the center, there is a 'Port Security System Settings' section with a 'System Maximum Address (1-3328)' input field containing 'No Limit' and an 'Apply' button. At the bottom, there is a 'Port Security Port Table' with columns for Port, Admin State, Lock Address Mode, and Max Learning Address. The table lists ports 1 through 13, all set to 'Disabled' Admin State and 'DeleteOnReset' Lock Address Mode, with a Max Learning Address of 32. Each row has 'Edit' and 'View Details' buttons.

Port	Admin State	Lock Address Mode	Max Learning Address	Edit	View Details
1	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>
2	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>
3	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>
4	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>
5	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>
6	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>
7	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>
8	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>
9	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>
10	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>
11	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>
12	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>
13	Disabled	DeleteOnReset	32	<input type="button" value="Edit"/>	<input type="button" value="View Details"/>

Figure 8-51 Port Security Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Port Security Trap Settings</b>	Use the radio button to enable or disable Port Security Traps on the Switch.
<b>Port Security Log Settings</b>	Use the radio button to enable or disable Port Security Logs on the Switch.

<b>System Maximum Address (1-3328)</b>	Enter the system maximum address.
<b>Unit</b>	Select the unit you want to configure.
<b>From Port / To Port</b>	Use the drop-down menus to select a range of ports to configure.
<b>Admin State</b>	Use the drop-down menu to enable or disable Port Security (locked MAC address table for the selected ports).
<b>Lock Address Mode</b>	This drop-down menu allows the option of how the MAC address table locking will be implemented on the Switch, for the selected group of ports. The options are: <i>Permanent</i> – The locked addresses will never age out unless users manually delete the entries, reboot or reset the Switch. <i>DeleteOnTimeout</i> – The locked addresses will age out after the aging timer expires. <i>DeleteOnReset</i> – The locked addresses will not age out until the Switch has been reset or rebooted.
<b>Max Learning Address (0-3328)</b>	Specify the maximum value of port security entries that can be learned on this port.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Edit** button to re-configure the specific entry.

Click the **View Detail** button to display the information of the specific entry.

Click the **View Detail** button to see the following window.

The screenshot shows the 'Port Security Port-VLAN Settings' window. At the top, there's a radio button for 'VLAN Name' which is selected, and another for 'VID List'. Below these are two input fields: one for 'Max Learning Address (0-3328)' containing 'No Limit' and another for 'VLAN Name' which is empty. On the right side, there's an 'Apply' button and a '<< Back' button. At the bottom, there's a table titled 'Port Security Port-VLAN Table' with columns for 'VLAN Name' and 'Max Learning Address'.

Figure 8-52 Port Security Port-VLAN Settings window

The fields that can be configured are described below:

Parameter	Description
<b>VLAN Name</b>	Click the radio button and enter a VLAN name.
<b>VID List</b>	Click the radio button and enter a list of VLAN ID.
<b>Max Learning Address (0-3328)</b>	Enter the maximum number of port security entries that can be learned by this VLAN. If this parameter is set to 0, it means that no user can be authorized on this VLAN. If the setting is lower than the number of current learned entries on the VLAN, the command will be rejected. Tick the <b>No Limit</b> check box to have unlimited number of port security entries that can be learned by a specific VLAN. The default value is No Limit.

Click the **Apply** button to accept the changes made.

Click the **<< Back** button to discard the changes made and return to the previous page.

## Port Security VLAN Settings

This window is used to configure the maximum number of port-security entries that can be learned on a specific VLAN. To view this window, click **Security > Port Security > Port Security VLAN Settings** as shown below:

Port Security VLAN Table (Only VLANs with limitation are displayed)		
VID	VLAN Name	Max Learning Address

**Figure 8-53 Port Security VLAN Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>VLAN Name</b>	Click the radio button and enter the VLAN Name.
<b>VID List</b>	Click the radio button and enter a list of the VLAN ID.
<b>Max Learning Address (0-3328)</b>	Enter the maximum number of port-security entries that can be learned by this VLAN. Tick the <b>No Limit</b> check box to have unlimited number of port-security entries that can be learned by this VLAN.

Click the **Apply** button to accept the changes made.

## Port Security Entries

This window is used to remove an entry from the port security entries learned by the Switch and entered into the forwarding database.

To view this window, click **Security > Port Security > Port Security Entries** as shown below:

Total Entries: 0			
VID	MAC Address	Port	Lock Mode

**Figure 8-54 Port Security Entries window**

The fields that can be configured or displayed are described below:

Parameter	Description
VLAN Name	The VLAN Name of the entry in the forwarding database table that has been permanently learned by the Switch.
VID List	The VLAN ID of the entry in the forwarding database table that has been permanently learned by the Switch.
Port List	Enter the port number or list here to be used for the port security entry search. When <b>All</b> is selected, all the ports configured will be displayed.
MAC Address	The MAC address of the entry in the forwarding database table that has been permanently learned by the Switch.
Lock Mode	The type of MAC address in the forwarding database table.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Clear** button to clear all the entries based on the information entered.

Click the **Show All** button to display all the existing entries.

Click the **Clear All** button to remove all the entries listed.

Click the **Delete** button to remove the specific entry.

## ARP Spoofing Prevention Settings

The user can configure the spoofing prevention entry to prevent spoofing of MAC for the protected gateway. When an entry is created, those ARP packets whose sender IP matches the gateway IP of an entry, but either its sender MAC field or source MAC field does not match the gateway MAC of the entry will be dropped by the system.

To view this window, click **Security > ARP Spoofing Prevention Settings** as shown below:

Total Entries: 1		
Gateway IP Address	Gateway MAC Address	Ports
192.168.69.1	00-11-22-33-44-55	6

Figure 8-55 ARP Spoofing Prevention Settings window

The fields that can be configured are described below:

Parameter	Description
Gateway IP Address	Enter the gateway IP address to help prevent ARP Spoofing.
Gateway MAC Address	Enter the gateway MAC address to help prevent ARP Spoofing.
Ports	Enter the port numbers that this feature applies to. Alternatively the user can select <b>All Ports</b> to apply this feature to all the ports of the switch.

Click the **Apply** button to accept the changes made.

Click the **Delete All** button to remove all the entries listed.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## BPDUs Attack Protection

This page is used to configure the BPDU protection function for the ports on the switch. In generally, there are two states in BPDU protection function. One is normal state, and another is under attack state. The under attack state have three modes: drop, block, and shutdown. A BPDU protection enabled port will enter an under attack state when it receives one STP BPDU packet. And it will take action based on the configuration. Thus, BPDU protection can only be enabled on the STP-disabled port.

BPDU protection has a higher priority than the FBPDU setting configured by configure STP command in the determination of BPDU handling. That is, when FBPDU is configured to forward STP BPDU but BPDU protection is enabled, then the port will not forward STP BPDU.

BPDU protection also has a higher priority than the BPDU tunnel port setting in determination of BPDU handling. That is, when a port is configured as BPDU tunnel port for STP, it will forward STP BPDU. But if the port is BPDU protection enabled. Then the port will not forward STP BPDU.

To view this window, click **Security > BPDU Attack Protection** as shown below:

The screenshot shows the 'BPDU Attack Protection' configuration window. At the top, there's a 'Global Settings' section with a 'BPDU Attack Protection State' radio button set to 'Disabled'. Below this are fields for 'Trap State' (set to 'None'), 'Recover Time (60-1000000)' (set to '60 sec'), and a checkbox for 'Infinite'. There are 'Apply' buttons for both the global settings and the specific unit configuration. The main part of the window is a table titled 'Unit 1 Settings' showing port configurations for 16 ports. All ports are listed as 'Disabled' with 'Shutdown' mode and 'Normal' status.

Port	State	Mode	Status
1	Disabled	Shutdown	Normal
2	Disabled	Shutdown	Normal
3	Disabled	Shutdown	Normal
4	Disabled	Shutdown	Normal
5	Disabled	Shutdown	Normal
6	Disabled	Shutdown	Normal
7	Disabled	Shutdown	Normal
8	Disabled	Shutdown	Normal
9	Disabled	Shutdown	Normal
10	Disabled	Shutdown	Normal
11	Disabled	Shutdown	Normal
12	Disabled	Shutdown	Normal
13	Disabled	Shutdown	Normal
14	Disabled	Shutdown	Normal
15	Disabled	Shutdown	Normal
16	Disabled	Shutdown	Normal

Figure 8-56 BPDU Attack Protection window

The fields that can be configured are described below:

Parameter	Description
BPDU Attack Protection State	Click the radio buttons to enable or disable the BPDU Attack Protection state.

<b>Trap State</b>	Specify when a trap will be sent. Options to choose from are <b>None</b> , <b>Attack Detected</b> , <b>Attack Cleared</b> or <b>Both</b> .
<b>Log State</b>	Specify when a log entry will be sent. Options to choose from are <b>None</b> , <b>Attack Detected</b> , <b>Attack Cleared</b> or <b>Both</b> .
<b>Recover Time (60-1000000)</b>	Enter the BPDU protection Auto-Recovery timer. The default value of the recovery timer is 60. Tick the <b>Infinite</b> check box for not auto recovering.
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select a range of ports to use for this configuration.
<b>State</b>	Use the drop-down menu to enable or disable the protection mode for a specific port.
<b>Mode</b>	<p>Specify the BPDU protection mode. The default mode is shutdown.</p> <p><i>Drop</i> – Drop all received BPDU packets when the port enters under attack state.</p> <p><i>Block</i> – Drop all packets (include BPDU and normal packets) when the port enters under attack state.</p> <p><i>Shutdown</i> – Shut down the port when the port enters under attack state.</p>

Click the **Apply** button to accept the changes made for each individual section.

# Loopback Detection Settings

The Loopback Detection (LBD) function is used to detect the loop created by a specific port. This feature is used to temporarily shut down a port on the Switch or block traffic through specific VLANs when a CTP (Configuration Testing Protocol) packet has been looped back to the Switch. When the Switch detects CTP packets received from a port or a VLAN, this signifies a loop on the network. The Switch will automatically block the port or the VLAN and send an alert to the administrator. The Loopback Detection port will restart (change to normal state) when the Loopback Detection Recover Time times out. The Loopback Detection function can be implemented on a range of ports at a time. The user may enable or disable this function using the drop-down menu.

To view this window, click **Security > Loopback Detection Settings** as shown below:

The screenshot shows the 'Loopback Detection Settings' window. At the top, there's a 'Loopback Detection Global Settings' section with a radio button for 'Enabled' (unchecked) and 'Disabled' (checked). Below this are fields for Mode (Port-based), Trap State (None), Log State (Enabled), Interval (1-32767) set to 10 sec, Recover Time (0 or 60-1000000) set to 60 sec, and Enabled VLANs (e.g.: 2-5) set to 1-4094 with the 'All VLANs' checkbox unchecked. There are 'Apply' buttons for both the global settings and the VLAN-specific row. Below these are two tables: 'Unit 1 Settings' which lists ports 1-10 all set to 'Disabled' and 'Normal' status, and a smaller table for 'Unit 1' with columns for Port, Loopback Detection State, and Loop Status.

Port	Loopback Detection State	Loop Status
1	Disabled	Normal
2	Disabled	Normal
3	Disabled	Normal
4	Disabled	Normal
5	Disabled	Normal
6	Disabled	Normal
7	Disabled	Normal
8	Disabled	Normal
9	Disabled	Normal
10	Disabled	Normal

Figure 8-57 Loopback Detection Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Loopback Detection State</b>	Use the radio button to enable or disable loopback detection. The default is Disabled.
<b>Mode</b>	Use the drop-down menu to toggle between <i>Port-based</i> and <i>VLAN-based</i> .
<b>Trap State</b>	Use the drop-down menu to set the desired trap status: <i>None</i> , <i>Loop Detected</i> , <i>Loop Cleared</i> , or <i>Both</i> .
<b>Log State</b>	Use the drop-down menu to enable or disable the state of the log for loopback detection.
<b>Interval (1-32767)</b>	The time interval (in seconds) that the device will transmit all the CTP (Configuration

	Test Protocol) packets to detect a loop-back event. The valid range is from 1 to 32767 seconds. The default setting is 10 seconds.
<b>Recover Time (0 or 60-1000000)</b>	Time allowed (in seconds) for recovery when a Loopback is detected. The Loop-detect Recover Time can be set at 0 seconds, or 60 to 1000000 seconds. Entering 0 will disable the Loop-detect Recover Time. The default is 60 seconds.
<b>Enabled VLANs</b>	This option is used to configure the loopback detection function for the VLANs on VLAN-based mode. Enter the list of VLAN used for this configuration here. Tick the <b>All VLANs</b> option to enable this option on all the VLANs configured on this switch.
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select a range of ports to use for this configuration.
<b>State</b>	Use the drop-down menu to toggle between <i>Enabled</i> and <i>Disabled</i> .

Click the **Apply** button to accept the changes made for each individual section.

## NetBIOS Filtering Settings

NetBIOS is an application programming interface, providing a set of functions that applications use to communicate across networks. NetBEUI, the NetBIOS Enhanced User Interface, was created as a data-link-layer frame structure for NetBIOS. A simple mechanism to carry NetBIOS traffic, NetBEUI has been the protocol of choice for small MS-DOS- and Windows-based workgroups. NetBIOS no longer lives strictly inside of the NetBEUI protocol. Microsoft worked to create the international standards described in RFC 1001 and RFC 1002, NetBIOS over TCP/IP (NBT).

If the network administrator wants to block the network communication on more than two computers which use NETBUEI protocol, it can use NETBIOS filtering to filter these kinds of packets.

If the user enables the NETBIOS filter, the switch will create one access profile and three access rules automatically. If the user enables the extensive NETBIOS filter, the switch will create one more access profile and one more access rule.

To view this window, click **Security > NetBIOS Filtering Settings** as shown below:

The screenshot displays the 'NetBIOS Filtering Settings' window with two main sections:

- NetBIOS Filtering (Filter NetBIOS over TCP/IP):** This section includes a dropdown for 'Unit' set to '1', a 'Ports:' list with checkboxes for ports 01 to 26, and buttons for 'Select All', 'Clear All', and 'Apply'.
- Extensive NetBIOS Filtering (Filter NetBIOS over 802.2):** This section also includes a dropdown for 'Unit' set to '1', a 'Ports:' list with checkboxes for ports 01 to 26, and buttons for 'Select All', 'Clear All', and 'Apply'.

Figure 8-58 NetBIOS Filtering Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you want to configure.
<b>NetBIOS Filtering Ports</b>	Select the appropriate port to include in the NetBIOS filtering configuration.
<b>Extensive NetBIOS Filtering Ports</b>	Select the appropriate port to include in the Extensive NetBIOS filtering configuration. Extensive NetBIOS is NetBIOS over 802.3. The Switch will deny the NetBIOS over 802.3 frame on these enabled ports.
<b>Ports</b>	Tick the appropriate ports to be configured.

Click the **Select All** button to select all ports in each individual section.

Click the **Clear All** button to deselect all ports in each individual section.

Click the **Apply** button to accept the changes made for each individual section.

## Traffic Segmentation Settings

Traffic segmentation is used to limit traffic flow from a single or group of ports, to a group of ports. This method of segmenting the flow of traffic is similar to using VLANs to limit traffic, but is more restrictive. It provides a method of directing traffic that does not increase the overhead of the master switch CPU.

To view this window, click **Security > Traffic Segmentation Settings** as shown below:

The screenshot shows the 'Traffic Segmentation Settings' window. At the top, there are two input fields for 'Port List' and 'Forward Port List', each with a dropdown menu and a 'All Ports' checkbox. To the right is an 'Apply' button. Below these are dropdown menus for 'Unit' (set to 1) and 'Forward Port List'. A large table lists 9 ports, each mapped to the same 'Forward Port List' value of '1:1-1:26'.

Port	Forward Port List
1	1:1-1:26
2	1:1-1:26
3	1:1-1:26
4	1:1-1:26
5	1:1-1:26
6	1:1-1:26
7	1:1-1:26
8	1:1-1:26
9	1:1-1:26

Figure 8-59 Traffic Segmentation Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Port List</b>	Enter a port or list of ports to be included in the traffic segmentation setup. Tick the <b>All Ports</b> check box to select all ports for the configuration.
<b>Forward Port List</b>	Enter a port or list of ports to be included in the traffic segmentation setup. Tick the <b>All Ports</b> check box to select all the ports for the configuration.
<b>Unit</b>	Select the unit you wish to configure.

Click the **Apply** button to accept the changes made.

# DHCP Server Screening

This function allows the user to not only to restrict all DHCP Server packets but also to receive any specified DHCP server packet by any specified DHCP client, it is useful when one or more DHCP servers are present on the network and both provide DHCP services to different distinct groups of clients.

The first time the DHCP filter is enabled it will create both an access profile entry and an access rule per port entry, it will also create other access rules. These rules are used to block all DHCP server packets. In addition to a permit DHCP entry it will also create one access profile and one access rule entry the first time the DHCP client MAC address is used as the client MAC address. The Source IP address is the same as the DHCP server's IP address (UDP port number 68). These rules are used to permit the DHCP server packets with specific fields, which the user has configured.

When DHCP Server filter function is enabled all DHCP Server packets will be filtered from a specific port.

## DHCP Server Screening Port Settings

The Switch supports DHCP Server Screening, a feature that denies access to rogue DHCP servers. When the DHCP server filter function is enabled, all DHCP server packets will be filtered from a specific port.

To view this window, click **Security > DHCP Server Screening > DHCP Server Screening Port Settings** as shown below:

Unit	From Port	To Port	State
1	01	01	Disabled

Unit 1 Settings	
Port	State

16	Disabled
17	Disabled
18	Disabled

Figure 8-60 DHCP Server Screening Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>DHCP Server Screening Trap State</b>	Click to enable or disable filtering DHCP server trap.
<b>DHCP Server Screening Log State</b>	Click to enable or disable filtering DHCP server log.
<b>Illegal Server Log Suppress Duration</b>	Choose an illegal server log suppress duration of 1 minute, 5 minutes, or 30 minutes.
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	A consecutive group of ports may be configured starting with the selected port.
<b>State</b>	Choose <i>Enabled</i> to enable the DHCP server screening or <i>Disabled</i> to disable it. The default is <i>Disabled</i> .

Click the **Apply** button to accept the changes made for each individual section.

## DHCP Offer Permit Entry Settings

Users can add or delete permit entries on this page.

To view this window, click **Security > DHCP Server Screening > DHCP Offer Permit Entry Settings** as shown below:

DHCP Offer Permit Entry Settings						
Server IP Address <input type="text" value="192.168.69.1"/>	Client's MAC Address <input type="text" value="00-11-22-33-44-55"/>	Ports (e.g.: 1-3, 5) <input type="text" value="7"/> <input type="checkbox"/> All Ports				
Total Entries: 1 <table border="1"> <tr> <td>Server IP Address 192.168.69.1</td> <td>Client's MAC Address 00-11-22-33-44-55</td> <td>Port 7</td> <td><input type="button" value="Delete"/></td> </tr> </table>			Server IP Address 192.168.69.1	Client's MAC Address 00-11-22-33-44-55	Port 7	<input type="button" value="Delete"/>
Server IP Address 192.168.69.1	Client's MAC Address 00-11-22-33-44-55	Port 7	<input type="button" value="Delete"/>			

Figure 8-61 DHCP Offer Permit Entry Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Server IP Address</b>	The IP address of the DHCP server to be permitted.
<b>Client's MAC Address</b>	The MAC address of the DHCP client.
<b>Ports</b>	The port numbers of the filter DHCP server. Tick the <b>All Ports</b> check box to include all the ports on this switch for this configuration.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry based on the information entered.

## Filter DHCPv6 Server

This page has two purposes: to specify to filter all DHCP server packets on the specific port and to specify to allow some DHCP server packets with pre-defined server IP addresses and client MAC addresses. With this function, we can restrict the DHCP server to service specific DHCP clients. This is useful when two DHCP servers are present on the network; one of them can provide the private IP address and the other can provide the public IP address.

Enabling filter DHCP server port state will create one access profile and create one access rule per port (UDP port is equal to 67). Filter commands in this file will share the same access profile. Addition of a permit DHCP entry will create one access profile and create one access rule. Filter commands in this file will share the same access profile.

To view this window, click **Security > DHCP Server Screening > Filter DHCPv6 Server** as shown below:

**Filter DHCPv6 Server**

Log State:  Enabled  Disabled

Trap State:  Enabled  Disabled

**Filter DHCPv6 Server State**

Ports (e.g.: 1:1-1:3, 1:5)  State:

Type:  All Ports

**DHCPv6 Server Permit**

Source IP Address  Ports (e.g.: 1:1-1:3, 1:5)   All Ports

**Total Entries: 1**

Source IP Address	Ports
3FF3::1	1:1-1:26

Figure 8-62 Filter DHCPv6 Server window

The fields that can be configured are described below:

Parameter	Description
<b>Log State</b>	This option is used to enable or disable the log for a DHCP server filter event.
<b>Trap State</b>	This option is used to enable or disable the trap for a DHCP server filter event.
<b>Filter DHCPv6 Server State</b>	This option is used to configure the filter DHCPv6 server state. <b>Ports:</b> Enter the list of ports used for this configuration here. Tick this <b>All Ports</b> option to include all the port in this configuration. <b>State:</b> Select to enable or disable this option's state.
<b>DHCPv6 Server Permit</b>	This option used to create a DHCPv6 server permit entry. The specific DHCPv6 server packets with the source IPv6 address will be forward on the specified port(s). <b>Source IP Address:</b> Enter the source address of the entry which will be created into the Filter DHCPv6 server forward list. <b>Ports:</b> Enter the list of ports, used for this configuration, here. Tick this <b>All Ports</b> option to include all the port in this configuration.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry based on the information entered.

## Filter ICMPv6

This window is used to configure the state of the filter ICMPv6 RA all-nodes packets on the switch. The filter ICMPv6 RA all-nodes function is used to filter the ICMPv6 RA all-nodes packets on the specific port(s) and receive the trust packets from the specific source. This feature can be protected network usable when a malicious host sends ICMPv6 RA all-nodes packets.

**Note:** It only needs to filter the packet of which the destination address is the all-nodes multicast address (FF02::1).

To view this window, click **Security > DHCP Server Screening > Filter ICMPv6** as shown below:

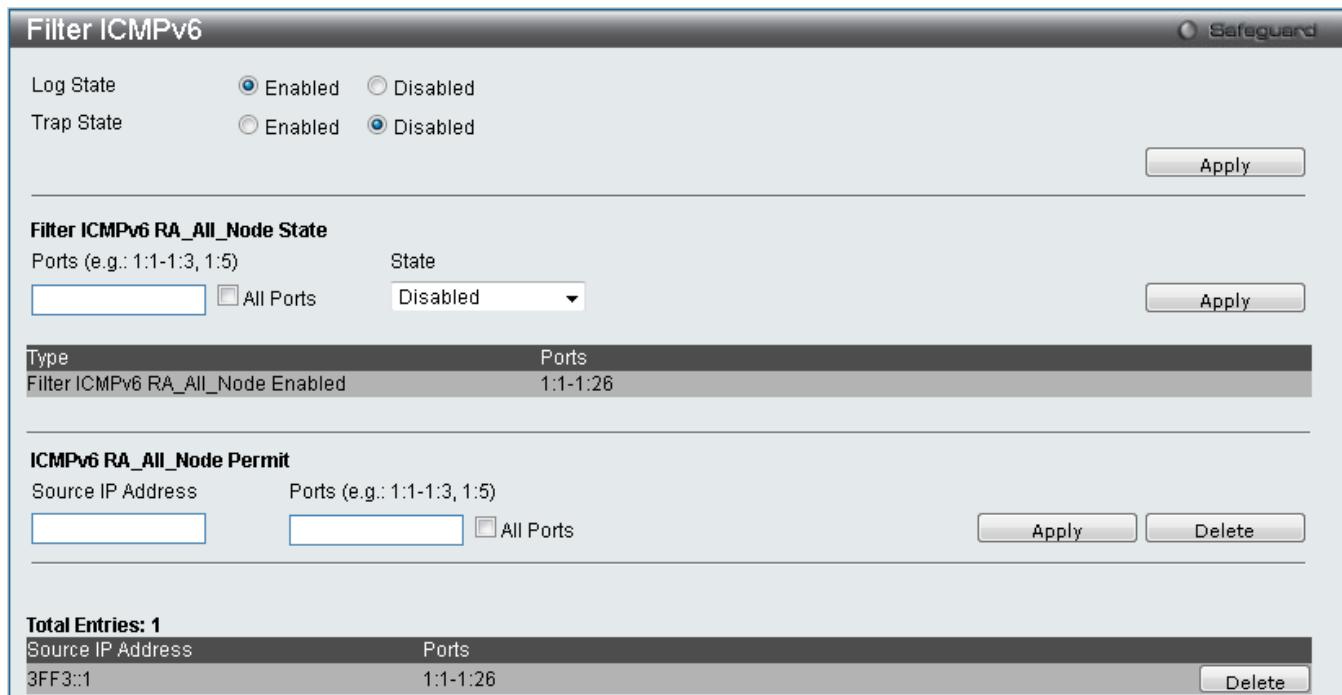

Figure 8-63 Filter ICMPv6 window

The fields that can be configured are described below:

Parameter	Description
<b>Log State</b>	This option is used to enable or disable the filter ICMPv6 RA All-nodes log state. When the filter ICMPv6 RA all-nodes log state is enabled, the log of the “Detected untrusted ICMPv6 All-nodes RA” will be generated.
<b>Trap State</b>	This option is used to enable or disable the filter ICMPv6 RA all-nodes trap state. When the filter ICMPv6 RA all-nodes trap state is enabled, the trap of the “illegal ICMPv6 all-nodes RA is detected” will be sent out. If the ICMPv6 RA all-nodes server trap state is disabled, no trap will be sent out.
<b>Filter ICMPv6 RA_All_Node State</b>	This option is used to configure the filter ICMPv6 state. <b>Ports:</b> Tick this <b>All Ports</b> option to include all the port in this configuration. <b>State:</b> Select to enable or disable this option's state.
<b>ICMPv6 RA_All_Node Permit</b>	This option is used to create a filter ICMPv6 RA All-nodes permit entry. <b>Source IP Address:</b> Enter the source address of entry which will be created into the Filter ICMPv6 RA All-nodes forward list here. <b>Ports:</b> Enter the list of ports, used for this configuration, here. Tick this <b>All Ports</b> option to include all the port in this configuration.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry based on the information entered.

## Access Authentication Control

The TACACS / XTACACS / TACACS+ / RADIUS commands allow users to secure access to the Switch using the TACACS / XTACACS / TACACS+ / RADIUS protocols. When a user logs in to the Switch or tries to access the administrator level privilege, he or she is prompted for a password. If TACACS / XTACACS / TACACS+ / RADIUS authentication is enabled on the Switch, it will contact a TACACS / XTACACS / TACACS+ / RADIUS server to verify the user. If the user is verified, he or she is granted access to the Switch.

There are currently three versions of the TACACS security protocol, each a separate entity. The Switch's software supports the following versions of TACACS:

- **TACACS (Terminal Access Controller Access Control System)** - Provides password checking and authentication, and notification of user actions for security purposes utilizing via one or more centralized TACACS servers, utilizing the UDP protocol for packet transmission.
- **Extended TACACS (XTACACS)** - An extension of the TACACS protocol with the ability to provide more types of authentication requests and more types of response codes than TACACS. This protocol also uses UDP to transmit packets.
- **TACACS+ (Terminal Access Controller Access Control System plus)** - Provides detailed access control for authentication for network devices. TACACS+ is facilitated through Authentication commands via one or more centralized servers. The TACACS+ protocol encrypts all traffic between the Switch and the TACACS+ daemon, using the TCP protocol to ensure reliable delivery

In order for the TACACS / XTACACS / TACACS+ / RADIUS security function to work properly, a TACACS / XTACACS / TACACS+ / RADIUS server must be configured on a device other than the Switch, called an Authentication Server Host and it must include usernames and passwords for authentication. When the user is prompted by the Switch to enter usernames and passwords for authentication, the Switch contacts the TACACS / XTACACS / TACACS+ / RADIUS server to verify, and the server will respond with one of three messages:

The server verifies the username and password, and the user is granted normal user privileges on the Switch.

The server will not accept the username and password and the user is denied access to the Switch.

The server doesn't respond to the verification query. At this point, the Switch receives the timeout from the server and then moves to the next method of verification configured in the method list.

The Switch has four built-in Authentication Server Groups, one for each of the TACACS, XTACACS, TACACS+ and RADIUS protocols. These built-in Authentication Server Groups are used to authenticate users trying to access the Switch. The users will set Authentication Server Hosts in a preferable order in the built-in Authentication Server Groups and when a user tries to gain access to the Switch, the Switch will ask the first Authentication Server Hosts for authentication. If no authentication is made, the second server host in the list will be queried, and so on. The built-in Authentication Server Groups can only have hosts that are running the specified protocol. For example, the TACACS Authentication Server Groups can only have TACACS Authentication Server Hosts.

The administrator for the Switch may set up six different authentication techniques per user-defined method list (TACACS / XTACACS / TACACS+ / RADIUS / local / none) for authentication. These techniques will be listed in an order preferable, and defined by the user for normal user authentication on the Switch, and may contain up to eight authentication techniques. When a user attempts to access the Switch, the Switch will select the first technique listed for authentication. If the first technique goes through its Authentication Server Hosts and no authentication is returned, the Switch will then go to the next technique listed in the server group for authentication, until the authentication has been verified or denied, or the list is exhausted.

Users granted access to the Switch will be granted normal user privileges on the Switch. To gain access to administrator level privileges, the user must access the **Enable Admin** window and then enter a password, which was previously configured by the administrator of the Switch.

This Switch supports the assignment of user privileges from the TACACS+ server.

**NOTE:** TACACS, XTACACS and TACACS+ are separate entities and are not compatible. The Switch and the server must be configured exactly the same, using the same protocol. (For example, if the Switch is set up for TACACS authentication, so must be the host server.)

## Enable Admin

Users who have logged on to the Switch on the normal user level and wish to be promoted to the administrator level can use this window. After logging on to the Switch, users will have only user level privileges. To gain access to administrator level privileges, the user will open this window and will have to enter an authentication password. Possible authentication methods for this function include TACACS/XTACACS/TACACS+/RADIUS, user defined server groups, local enable (local account on the Switch), or no authentication (none). Because XTACACS and TACACS do not support the enable function, the user must create a special account on the server host, which has the username "enable", and a password configured by the administrator that will support the "enable" function. This function becomes inoperable when the authentication policy is disabled.

To view this window, click **Security > Access Authentication Control > Enable Admin** as shown below:

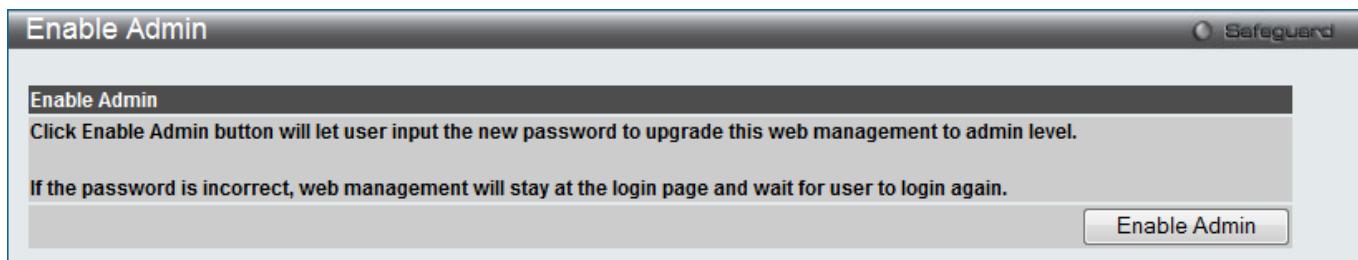

Figure 8-64 Enable Admin window

When this window appears, click the **Enable Admin** button revealing a window for the user to enter authentication (password, username), as shown below. A successful entry will promote the user to Administrator level privileges on the Switch.

Figure 8-65 Log-in Page

## Authentication Policy Settings

Users can enable an administrator-defined authentication policy for users trying to access the Switch. When enabled, the device will check the Login Method List and choose a technique for user authentication upon login.

To view this window, click **Security > Access Authentication Control > Authentication Policy Settings** as shown below:

Authentication Policy Settings			
Authentication Policy	Disabled	Authentication Policy Encryption	Disabled
User Attempts (1-255)	3 times	Response Timeout (0-255)	30 sec
<input type="button" value="Apply"/>			

**Figure 8-66 Authentication Policy Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Authentication Policy</b>	Use the drop-down menu to enable or disable the Authentication Policy on the Switch.
<b>Authentication Policy Encryption</b>	Use the drop-down menu to enable or disable authentication policy encryption.
<b>User Attempts (1-255)</b>	Enter the maximum number of times that the Switch will accept authentication attempts. Users failing to be authenticated after the set amount of attempts will be denied access to the Switch and will be locked out of further authentication attempts. Command line interface users will have to wait 60 seconds before another authentication attempt. Telnet and web users will be disconnected from the Switch. The default setting is 3.
<b>Response Timeout (0-255)</b>	Enter the time that the Switch will wait for a response of authentication from the user. The default setting is 30 seconds.

Click the **Apply** button to accept the changes made.

## Application Authentication Settings

Users can configure Switch configuration applications (console, Telnet, SSH, web) for login at the user level and at the administration level (Enable Admin) utilizing a previously configured method list.

To view this window, click **Security > Access Authentication Control > Application Authentication Settings** as shown below:

Application Authentication Settings			
Application	Login Method List	Enable Method List	
Console	default	default	<input type="button" value="Apply"/>
Telnet	default	default	
SSH	default	default	
HTTP	default	default	

**Figure 8-67 Application Authentication Settings window**

The fields that can be configured or displayed are described below:

Parameter	Description
<b>Application</b>	Lists the configuration applications on the Switch. The user may configure the Login Method List and Enable Method List for authentication for users utilizing the Console (Command Line Interface) application, the Telnet application, SSH, and the Web (HTTP) application.
<b>Login Method List</b>	Use the drop-down menu to configure an application for normal login on the user level, utilizing a previously configured method list. The user may use the default Method List or other Method List configured by the user. See the Login Method Lists Settings window, in this section, for more information.
<b>Enable Method List</b>	Use the drop-down menu to configure an application to promote user level to admin-level users utilizing a previously configured method list. The user may use the default Method List or other Method List configured by the user. See the Login Method Lists Settings window, in this section, for more information

Click the **Apply** button to accept the changes made.

## Accounting Settings

Users can configure the state of the specified RADIUS accounting service.

To view this window, click **Security > Access Authentication Control > Accounting Settings** as shown below:

The screenshot shows the 'Accounting Settings' window with the following configuration:

- Network:** Disabled
- Shell:** Disabled
- System:** Disabled
- Command Service Method List Name Settings:**
  - Administrator:** None
  - Operator:** None
  - Power User:** None
  - User:** None

An 'Apply' button is located at the bottom right of the window.

**Network:** When enabled, the switch will send informational packets to a remote server when 802.1X, WAC and JWAC port access control events occur on the switch.

**Shell:** When enabled, the switch will send informational packets to a remote server when a user either logs in, logs out or times out on the switch, using the console, Telnet, or SSH.

**System:** When enabled, the switch will send informational packets to a remote server when system events occur on the switch, such as a system reset or system boot.

**Command Accounting:** It's the service for all administrator, operator, power user or user level commands. When it selects method list name, it specifies accounting service by the AAA user defined method list. When it selects none, the switch disables AAA command accounting services by specified command level.

Figure 8-68 Accounting Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Network</b>	When <i>RADIUS Only</i> is selected, the Switch will send network informational packets to a remote RADIUS server. When <i>Method List Name</i> is selected, the Switch will send network informational packets based on the method list created.
<b>Shell</b>	When <i>RADIUS Only</i> is selected, the Switch will send shell informational packets to a

	remote RADIUS server. When <i>Method List Name</i> is selected, the Switch will send shell informational packets based on the method list created.
<b>System</b>	When <i>RADIUS Only</i> is selected, the Switch will send system informational packets to a remote RADIUS server. When <i>Method List Name</i> is selected, the Switch will send system informational packets based on the method list created.
<b>Administrator</b>	When selected, the accounting service for all administrator level commands will be enabled.
<b>Operator</b>	When selected, the accounting service for all operator level commands will be enabled.
<b>Power User</b>	When selected, the accounting service for all power-user level commands will be enabled.
<b>User</b>	When selected, the accounting service for all user level commands will be enabled.

Click the **Apply** button to accept the changes made.

## Authentication Server Group Settings

This window is used to set up Authentication Server Groups on the Switch. A server group is a technique used to group TACACS/XTACACS/TACACS+/RADIUS server hosts into user-defined categories for authentication using method lists. The user may define the type of server group by protocol or by previously defined server group. The Switch has four built-in Authentication Server Groups that cannot be removed but can be modified. Up to eight authentication server hosts may be added to any particular group.

To view this window, click **Security > Access Authentication Control > Authentication Server Group Settings** as shown below:

Group Name (Max: 15 characters)	
<input type="text"/>	
<b>Add</b>	
<b>Total Entries: 4</b>	
<b>Group Name</b>	
radius	<b>Edit</b>
tacacs	<b>Edit</b>
tacacs+	<b>Edit</b>
xtacacs	<b>Edit</b>

Figure 8-69 Authentication Server Group Settings – Server Group List window

This window displays the Authentication Server Groups on the Switch. The Switch has four built-in Authentication Server Groups that cannot be removed but can be modified.

The fields that can be configured are described below:

Parameter	Description
-----------	-------------

<b>Group Name</b>	Enter a new server group name.
-------------------	--------------------------------

Click the **Add** button to add a new entry based on the information entered.

Click the **Edit** button (or the **Edit Server Group** tab) to re-configure the specific entry.

Click the **Edit Server Group** tab to see the following window.

Figure 8-70 Authentication Server Group Settings – Edit Server Group window

The fields that can be configured are described below:

Parameter	Description
<b>Group Name</b>	Enter a server group name.
<b>IP Address</b>	Enter the IP address of the server host.
<b>Protocol</b>	use the drop-down menu to choose the <b>Protocol</b> associated with the IP address of the Authentication Server Host

Click the **Add** button to add a new entry based on the information entered.

**NOTE:** The user must configure Authentication Server Hosts using the Authentication Server Hosts window before adding hosts to the list. Authentication Server Hosts must be configured for their specific protocol on a remote centralized server before this function can work properly.

**NOTE:** The three built-in server groups can only have server hosts running the same TACACS daemon. TACACS/XTACACS/TACACS+ protocols are separate entities and are not compatible with each other.

## Authentication Server Settings

User-defined Authentication Server Hosts for the TACACS / XTACACS / TACACS+ / RADIUS security protocols can be set on the Switch. When a user attempts to access the Switch with Authentication Policy enabled, the Switch will

send authentication packets to a remote TACACS / XTACACS / TACACS+ / RADIUS server host on a remote host. The TACACS / XTACACS / TACACS+ / RADIUS server host will then verify or deny the request and return the appropriate message to the Switch. More than one authentication protocol can be run on the same physical server host but, remember that TACACS / XTACACS / TACACS+ / RADIUS are separate entities and are not compatible with each other. The maximum supported number of server hosts is 16.

To view this window, click **Security > Access Authentication Control > Authentication Server Settings** as shown below:

The screenshot shows the 'Authentication Server Settings' window. At the top, there are input fields for IP Address (49), Protocol (TACACS), Timeout (5 sec), Key (49), and Retransmit (2 times). Below these are buttons for 'Apply' and 'Safeguard'. A table titled 'Total Entries: 1' lists one entry: IP Address 10.90.90.10, Protocol TACACS, Port 49, Timeout 5, Key -----, and Retransmit 2. There are 'Edit' and 'Delete' buttons for this entry.

Figure 8-71 Authentication Server Settings window

The fields that can be configured are described below:

Parameter	Description
<b>IP Address</b>	The IP address of the remote server host to add.
<b>Protocol</b>	The protocol used by the server host. The user may choose one of the following: TACACS - Enter this parameter if the server host utilizes the TACACS protocol. XTACACS - Enter this parameter if the server host utilizes the XTACACS protocol. TACACS+ - Enter this parameter if the server host utilizes the TACACS+ protocol. RADIUS - Enter this parameter if the server host utilizes the RADIUS protocol.
<b>Key</b>	Authentication key to be shared with a configured TACACS+ or RADIUS servers only. Specify an alphanumeric string up to 254 characters.
<b>Port (1-65535)</b>	Enter a number between 1 and 65535 to define the virtual port number of the authentication protocol on a server host. The default port number is 49 for TACACS/XTACACS/TACACS+ servers and 1812 for RADIUS servers but the user may set a unique port number for higher security.
<b>Timeout (1-255)</b>	Enter the time in seconds the Switch will wait for the server host to reply to an authentication request. The default value is 5 seconds.
<b>Retransmit (1-20)</b>	Enter the value in the retransmit field to change how many times the device will resend an authentication request when the TACACS server does not respond.

Click the **Apply** button to accept the changes made.

**NOTE:** More than one authentication protocol can be run on the same physical server host but, remember that TACACS/XTACACS/TACACS+ are separate entities and are not compatible with each other.

## Login Method Lists Settings

User-defined or default Login Method List of authentication techniques can be configured for users logging on to the Switch. The sequence of techniques implemented in this command will affect the authentication result. For example, if a user enters a sequence of techniques, for example TACACS - XTACACS- local, the Switch will send an

authentication request to the first TACACS host in the server group. If no response comes from the server host, the Switch will send an authentication request to the second TACACS host in the server group and so on, until the list is exhausted. At that point, the Switch will restart the same sequence with the following protocol listed, XTACACS. If no authentication takes place using the XTACACS list, the local account database set in the Switch is used to authenticate the user. When the local method is used, the privilege level will be dependent on the local account privilege configured on the Switch.

Successful login using any of these techniques will give the user a "User" privilege only. If the user wishes to upgrade his or her status to the administrator level, the user must use the **Enable Admin** window, in which the user must enter a previously configured password, set by the administrator.

To view this window, click **Security > Access Authentication Control > Login Method Lists Settings** as shown below:

Method List Name	Priority 1	Priority 2	Priority 3	Priority 4		
default	local	---	---	---	<a href="#">Edit</a>	<a href="#">Delete</a>

Figure 8-72 Login Method Lists Settings window

The Switch contains one Method List that is set and cannot be removed, yet can be modified. To delete a Login Method List defined by the user, click the **Delete** button corresponding to the entry desired to be deleted. To modify a Login Method List, click its corresponding **Edit** button.

The fields that can be configured are described below:

Parameter	Description
<b>Method List Name</b>	Enter a method list name defined by the user of up to 15 characters.
<b>Priority 1, 2, 3, 4</b>	The user may add one, or a combination of up to four of the following authentication methods to this method list:  <i>tacacs</i> - Adding this parameter will require the user to be authenticated using the TACACS protocol from a remote TACACS server. <i>xtacacs</i> - Adding this parameter will require the user to be authenticated using the XTACACS protocol from a remote XTACACS server. <i>tacacs+</i> - Adding this parameter will require the user to be authenticated using the TACACS+ protocol from a remote TACACS+ server. <i>radius</i> - Adding this parameter will require the user to be authenticated using the RADIUS protocol from a remote RADIUS server. <i>local</i> - Adding this parameter will require the user to be authenticated using the local user account database on the Switch. <i>none</i> - Adding this parameter will require no authentication needed to access the Switch.

Click the **Apply** button to accept the changes made.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## Enable Method Lists Settings

Users can set up Method Lists to promote users with user level privileges to Administrator (Admin) level privileges using authentication methods on the Switch. Once a user acquires normal user level privileges on the Switch, he or she must be authenticated by a method on the Switch to gain administrator privileges on the Switch, which is defined by the Administrator. A maximum of eight Enable Method Lists can be implemented on the Switch, one of which is a default Enable Method List. This default Enable Method List cannot be deleted but can be configured.

The sequence of methods implemented in this command will affect the authentication result. For example, if a user enters a sequence of methods like TACACS - XTACACS - Local Enable, the Switch will send an authentication request to the first TACACS host in the server group. If no verification is found, the Switch will send an authentication request to the second TACACS host in the server group and so on, until the list is exhausted. At that point, the Switch will restart the same sequence with the following protocol listed, XTACACS. If no authentication takes place using the XTACACS list, the Local Enable password set in the Switch is used to authenticate the user.

Successful authentication using any of these methods will give the user an "Admin" privilege.

**NOTE:** To set the Local Enable Password, see the next section, entitled Local Enable Password.

To view this window, click **Security > Access Authentication Control > Enable method Lists Settings** as shown below:

Total Entries: 1					
Method List Name	Priority 1	Priority 2	Priority 3	Priority 4	
default	local_enable	---	---	---	<a href="#">Edit</a> <a href="#">Delete</a>

**Figure 8-73 Enable method Lists Settings window**

To delete an Enable Method List defined by the user, click the **Delete** button corresponding to the entry desired to be deleted. To modify an Enable Method List, click its corresponding **Edit** button.

The fields that can be configured are described below:

Parameter	Description
<b>Method List Name</b>	Enter a method list name defined by the user of up to 15 characters.
<b>Priority 1, 2, 3, 4</b>	The user may add one, or a combination of up to four of the following authentication methods to this method list: <i>local_enable</i> - Adding this parameter will require the user to be authenticated using the local enable password database on the Switch. The local enable password must be set by the user in the next section entitled Local Enable Password.

	<p><i>none</i> - Adding this parameter will require no authentication needed to access the Switch.</p> <p><i>radius</i> - Adding this parameter will require the user to be authenticated using the RADIUS protocol from a remote RADIUS server.</p> <p><i>tacacs</i> - Adding this parameter will require the user to be authenticated using the TACACS protocol from a remote TACACS server.</p> <p><i>xtacacs</i> - Adding this parameter will require the user to be authenticated using the XTACACS protocol from a remote XTACACS server.</p> <p><i>tacacs+</i> - Adding this parameter will require the user to be authenticated using the TACACS protocol from a remote TACACS server.</p>
--	--

Click the **Apply** button to accept the changes made.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## Accounting Method Lists Settings

Here users can create and configure accounting method lists on the Switch.

To view this window, click **Security > Access Authentication Control > Accounting Method Lists Settings** as shown below:

Total Entries: 1				
Method List Name	Priority 1	Priority 2	Priority 3	Priority 4
default	none	---	---	---

**Edit**    **Delete**

Figure 8-74 Accounting Method Lists Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Method List Name</b>	Enter a method list name defined by the user of up to 15 characters.
<b>Priority 1, 2, 3, 4</b>	<p>The user may add one, or a combination of up to four of the following accounting methods to this method list:</p> <p><i>none</i> - Adding this parameter will require no accounting.</p> <p><i>radius</i> - Adding this parameter will require the user to be accounting using the RADIUS protocol from a remote RADIUS server.</p> <p><i>tacacs+</i> - Adding this parameter will require the user to be accounting using the TACACS protocol from a remote TACACS server.</p>

Click the **Apply** button to accept the changes made.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to an Enable Method List defined by the user.

## Local Enable Password Settings

Users can configure the locally enabled password for Enable Admin. When a user chooses the "local\_enable" method to promote user level privileges to administrator privileges, he or she will be prompted to enter the password configured here that is locally set on the Switch.

To view this window, click **Security > Access Authentication Control > Local Enable Password Settings** as shown below:

Local Enable Password Settings	
Encryption	<input type="button" value="None"/>
Old Local Enable Password	<input type="text"/>
New Local Enable Password	<input type="text"/>
Confirm Local Enable Password	<input type="text"/>
Local Enable Password	<input type="text"/>
<input type="button" value="Apply"/>	

Figure 8-75 Local Enable Password Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Encryption</b>	Specifies the encryption type to be used for the password. <i>Plain Text</i> - Specifies that the password entered should be in plain text form. <i>SHA1</i> - Specifies that the password entered should be in SHA-1 encrypted form.
<b>Old Local Enable Password</b>	If a password was previously configured for this entry, enter it here in order to change it to a new password
<b>New Local Enable Password</b>	Enter the new password that you wish to set on the Switch to authenticate users attempting to access Administrator Level privileges on the Switch. The user may set a password of up to 15 characters.
<b>Confirm Local Enable Password</b>	Confirm the new password entered above. Entering a different password here from the one set in the New Local Enabled field will result in a fail message.
<b>Local Enable Password</b>	After selecting one of the <b>Encryption</b> options, the user can enter the local password used here.

Click the **Apply** button to accept the changes made.

## Authentication Source IP Interface Settings

This window is used to specify source interface for all outgoing RADIUS and TACACS packets.

To view this window, click **Security > Access Authentication Control > Authentication Source IP Interface Settings** as shown below:

The screenshot shows the 'Authentication Source IP Interface Settings' window. It contains two main sections: 'Radius Source IP Interface Settings' and 'Tacacs Source IP Interface Settings'. Each section has two input fields: 'Interface Name' and 'IPv4 Address'. Below each section are 'Apply' and 'Clear' buttons. The 'Radius' section is at the top, and the 'Tacacs' section is below it.

Figure 8-76 Authentication Source IP Interface window

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Enter the interface name that will be used as the source interface for all outgoing RADIUS and TACACS packets.
<b>IPv4 Address</b>	Enter the IPv4 address that will be used as the source IPv4 address for all outgoing RADIUS and TACACS packets.

Click the **Apply** button to accept the changes made.

Click the **Clear** button to clear out all information entered.

## SSL Settings

Secure Sockets Layer, or SSL, is a security feature that will provide a secure communication path between a host and client through the use of authentication, digital signatures and encryption. These security functions are implemented through the use of a cipher suite, which is a security string that determines the exact cryptographic parameters, specific encryption algorithms and key sizes to be used for an authentication session and consists of three levels:

- 1 **Key Exchange:** The first part of the Cipher suite string specifies the public key algorithm to be used. This switch utilizes the Rivest Shamir Adleman (RSA) public key algorithm and the Digital Signature Algorithm (DSA), specified here as the DHE DSS Diffie-Hellman (DHE) public key algorithm. This is the first authentication process between client and host as they "exchange keys" in looking for a match and therefore authentication to be accepted to negotiate encryptions on the following level.
- 2 **Encryption:** The second part of the cipher suite that includes the encryption used for encrypting the messages sent between client and host. The Switch supports two types of cryptology algorithms:  
Stream Ciphers – There are two types of stream ciphers on the Switch, *RC4 with 40-bit keys* and *RC4 with 128-bit keys*. These keys are used to encrypt messages and need to be consistent between client and host for optimal use.  
CBC Block Ciphers – CBC refers to Cipher Block Chaining, which means that a portion of the previously encrypted block of encrypted text is used in the encryption of the current block. The Switch supports the *3DES EDE* encryption code defined by the Data Encryption Standard (DES) to create the encrypted text.
- 3 **Hash Algorithm:** This part of the cipher suite allows the user to choose a message digest function which will determine a Message Authentication Code. This Message Authentication Code will be encrypted with a sent message to provide integrity and prevent against replay attacks. The Switch supports two hash algorithms, MD5 (Message Digest 5) and SHA (Secure Hash Algorithm).

These three parameters are uniquely assembled in four choices on the Switch to create a three-layered encryption code for secure communication between the server and the host. The user may implement any one or combination of the cipher suites available, yet different cipher suites will affect the security level and the performance of the secured connection. The information included in the cipher suites is not included with the Switch and requires downloading from

a third source in a file form called a *certificate*. This function of the Switch cannot be executed without the presence and implementation of the certificate file and can be downloaded to the Switch by utilizing a TFTP server. The Switch supports SSLv3. Other versions of SSL may not be compatible with this Switch and may cause problems upon authentication and transfer of messages from client to host.

The SSL Settings window located on the next page will allow the user to enable SSL on the Switch and implement any one or combination of listed cipher suites on the Switch. A cipher suite is a security string that determines the exact cryptographic parameters, specific encryption algorithms and key sizes to be used for an authentication session. The Switch possesses four possible cipher suites for the SSL function, which are all enabled by default. To utilize a particular cipher suite, disable the unwanted cipher suites, leaving the desired one for authentication.

When the SSL function has been enabled, the web will become disabled. To manage the Switch through the web based management while utilizing the SSL function, the web browser must support SSL encryption and the header of the URL must begin with https://. (Ex. https://xx.xx.xx.xx) Any other method will result in an error and no access can be authorized for the web-based management.

Users can download a certificate file for the SSL function on the Switch from a TFTP server. The certificate file is a data record used for authenticating devices on the network. It contains information on the owner, keys for authentication and digital signatures. Both the server and the client must have consistent certificate files for optimal use of the SSL function. The Switch only supports certificate files with .der file extensions. Currently, the Switch comes with a certificate pre-loaded though the user may need to download more, depending on user circumstances.

To view this window, click **Security > SSL Settings** as shown below:

**SSL Settings**

**SSL Settings**

SSL State  Enabled  Disabled

Cache Timeout (60 - 86400)  sec

**Note:** Web will be disabled if SSL is enabled.

Figure 8-77 SSL Settings window

To set up the SSL function on the Switch, configure the parameters in the SSL Settings section described.

The fields that can be configured are described below:

Parameter	Description
<b>SSL Status</b>	Use the radio buttons to enable or disable the SSL status on the Switch. The default is Disabled.
<b>Cache Timeout (60-86400)</b>	This field will set the time between a new key exchange between a client and a host using the SSL function. A new SSL session is established every time the client and

	host go through a key exchange. Specifying a longer timeout will allow the SSL session to reuse the master key on future connections with that particular host, therefore speeding up the negotiation process. The default setting is 600 seconds.
--	--

Click the **Apply** button to accept the changes made.

To set up the **SSL cipher suite function** on the Switch, configure the parameters in the SSL Cipher suite Settings section described below:

Parameter	Description
<b>RSA with RC4_128_MD5</b>	This cipher suite combines the RSA key exchange, stream cipher RC4 encryption with 128-bit keys and the MD5 Hash Algorithm. Use the radio buttons to enable or disable this cipher suite. This field is Enabled by default.
<b>RSA with 3DES EDE CBC SHA</b>	This cipher suite combines the RSA key exchange, CBC Block Cipher 3DES_EDE encryption and the SHA Hash Algorithm. Use the radio buttons to enable or disable this cipher suite. This field is Enabled by default.
<b>DHS DSS with 3DES EDE CBC SHA</b>	This cipher suite combines the DSA Diffie Hellman key exchange, CBC Block Cipher 3DES_EDE encryption and SHA Hash Algorithm. Use the radio buttons to enable or disable this cipher suite. This field is Enabled by default.
<b>RSA EXPORT with RC4 40 MD5</b>	This cipher suite combines the RSA Export key exchange and stream cipher RC4 encryption with 40-bit keys. Use the radio buttons to enable or disable this cipher suite. This field is Enabled by default.

Click the **Apply** button to accept the changes made.

To download SSL certificates, configure the parameters in the SSL Certificate Download section described below.

Parameter	Description
<b>Server IP Address</b>	Enter the IPv4 address of the TFTP server where the certificate files are located.
<b>Certificate File Name</b>	Enter the path and the filename of the certificate file to download. This file must have a .der extension. (Ex. c:/cert.der)
<b>Key File Nam</b>	Enter the path and the filename of the key file to download. This file must have a .der extension (Ex. c:/pkey.der)

Click the **Download** button to download the SSL certificate based on the information entered.

**NOTE:** Certain implementations concerning the function and configuration of SSL are not available on the web-based management of this Switch and need to be configured using the command line interface.

**NOTE:** Enabling the SSL command will disable the web-based switch management. To log on to the Switch again, the header of the URL must begin with https://. Entering anything else into the address field of the web browser will result in an error and no authentication will be granted.

## SSL Certification Settings

This window is used to configure the SSL certification settings

To view this window, click **Security > SSL > SSL Certification Settings** as shown below:

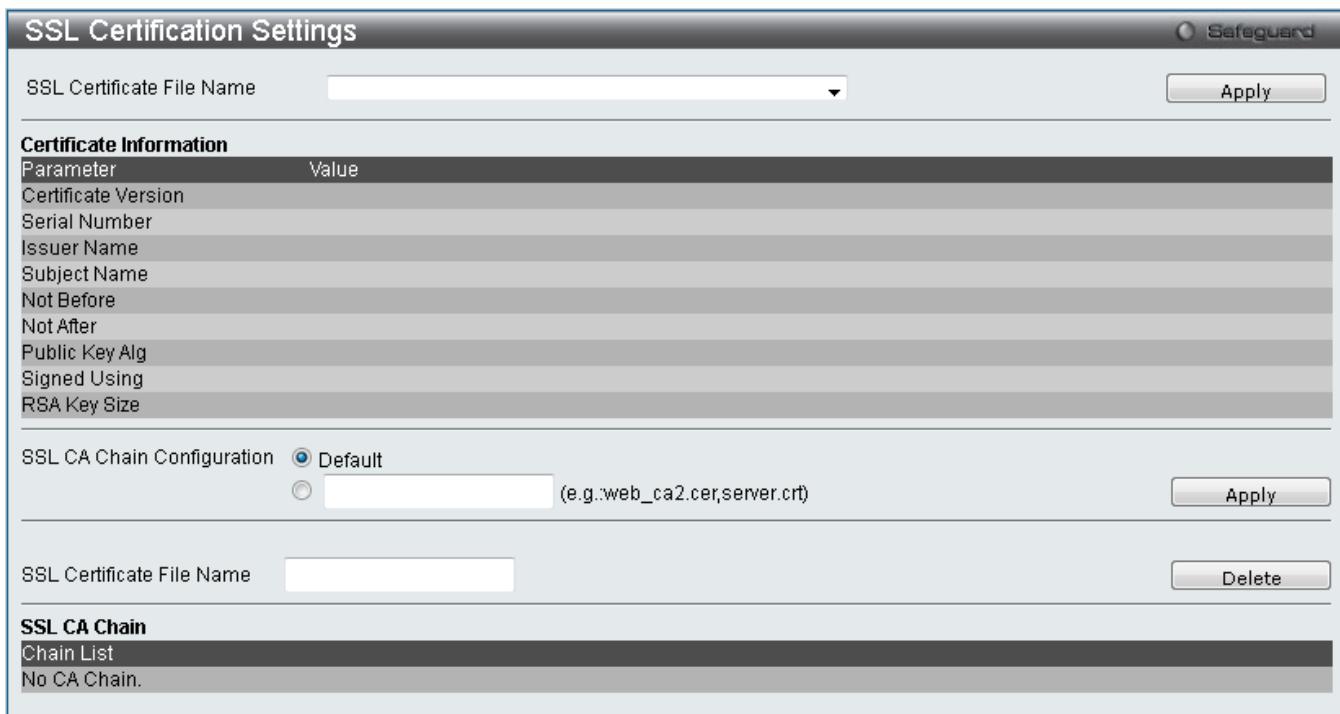

Figure 8-78 SSL Certification Settings window

The fields that can be configured are described below:

Parameter	Description
<b>SSL Certification File Name</b>	Use the drop-down menu to select the SSL Certification File Name.
<b>SSL CA Chain Configuration</b>	Enter the chain of certifications on the Switch. Click the <b>Default</b> button to use all the certificates which were downloaded to the Switch to constitute a certificate chain.
<b>SSL Certificate File Name</b>	Enter an SSL certificate file name to be deleted.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Delete** button to remove the specific entry.

## SSH

SSH is an abbreviation of Secure Shell, which is a program allowing secure remote login and secure network services over an insecure network. It allows a secure login to remote host computers, a safe method of executing commands on a remote end node, and will provide secure encrypted and authenticated communication between two non-trusted hosts. SSH, with its array of unmatched security features is an essential tool in today's networking environment. It is a powerful guardian against numerous existing security hazards that now threaten network communications.

The steps required to use the SSH protocol for secure communication between a remote PC (the SSH client) and the Switch (the SSH server) are as follows:

- 1 Create a user account with admin-level access using the **User Accounts** window. This is identical to creating any other admin-level User Account on the Switch, including specifying a password. This password is used to logon to the Switch, once a secure communication path has been established using the SSH protocol.
- 2 Configure the User Account to use a specified authorization method to identify users that are allowed to establish SSH connections with the Switch using the **SSH User Authentication Mode** window. There are three choices as to the method SSH will use to authorize the user, which are Host Based, Password, and Public Key.

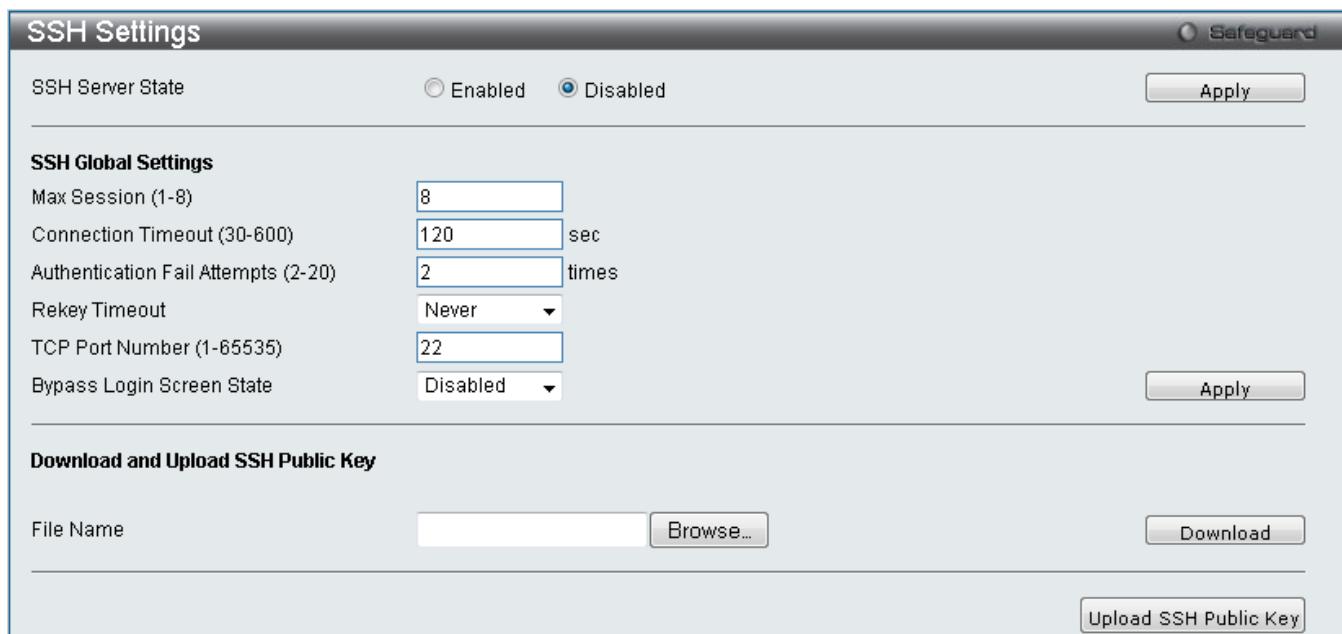

- 3 Configure the encryption algorithm that SSH will use to encrypt and decrypt messages sent between the SSH client and the SSH server, using the SSH Authentication Method and Algorithm Settings window.
- 4 Finally, enable SSH on the Switch using the SSH Configuration window.

After completing the preceding steps, a SSH Client on a remote PC can be configured to manage the Switch using a secure, in band connection.

## SSH Settings

Users can configure and view settings for the SSH server.

To view this window, click **Security > SSH > SSH Settings** as shown below:

**Figure 8-79 SSH Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>SSH Server State</b>	Use the radio buttons to enable or disable SSH on the Switch. The default is Disabled.
<b>Max. Session (1-8)</b>	Enter a value between 1 and 8 to set the number of users that may simultaneously access the Switch. The default setting is 8.
<b>Connection Timeout (30-600)</b>	Allows the user to set the connection timeout. The user may set a time between 30 and 600 seconds. The default setting is 120 seconds.
<b>Authfail Attempts (2-20)</b>	Allows the Administrator to set the maximum number of attempts that a user may try to log on to the SSH Server utilizing the SSH authentication. After the maximum number of attempts has been exceeded, the Switch will be disconnected and the user must reconnect to the Switch to attempt another login. The number of maximum attempts may be set between 2 and 20. The default setting is 2.
<b>Rekey Timeout</b>	Use the drop-down menu to set the time period that the Switch will change the security shell encryptions by using the drop-down menu. The available options are <i>Never</i> , <i>10 min</i> , <i>30 min</i> , and <i>60 min</i> . The default setting is <i>Never</i> .
<b>TCP Port Number (1-65535)</b>	Enter the TCP Port Number used for SSH. The default value is 22.

<b>Bypass Login Screen State</b>	Specifies to bypass the username and password login screen to avoid a secondary authentication after using SSH public key authentication. If this method is specified, the login user using SSH public key authentication can execute command directly with the initial privilege level of the login user.
----------------------------------	--

Click the **Apply** button to accept the changes made for each individual section.

On this page the user can also download the SSH public key file on client computer to the switch through TFTP protocol. Click the **Browse** button to navigate to the key file, located on the client computer, and click the **Download** button to initiate the download.

Click the **Upload SSH Public Key** button to upload the SSH public key file from the switch to a computer through the TFTP protocol.

## SSH Authentication Method and Algorithm Settings

Users can configure the desired types of SSH algorithms used for authentication encryption. There are three categories of algorithms listed and specific algorithms of each may be enabled or disabled by ticking their corresponding check boxes. All algorithms are enabled by default.

To view this window, click **Security > SSH > SSH Authentication method and Algorithm Settings** as shown below:

Figure 8-80 SSH Authentication Method and Algorithm Settings window

The fields that can be configured for **SSH Authentication Mode** are described below:

Parameter	Description
<b>Password</b>	This may be enabled or disabled to choose if the administrator wishes to use a password method, including AAA and locally configured password, based on the configuration of the administrator, for authentication on the Switch. This parameter is enabled by default.
<b>Public Key</b>	This may be enabled or disabled to choose if the administrator wishes to use a public key configuration set on a SSH server, for authentication. This parameter is enabled by default.
<b>Host-based</b>	This may be enabled or disabled to choose if the administrator wishes to use a host computer for authentication. This parameter is intended for Linux users requiring SSH authentication techniques and the host computer is running the Linux operating system with a SSH program previously installed. This parameter is enabled by default.

Click the **Apply** button to accept the changes made.

The fields that can be configured for the **Encryption Algorithm** are described below:

Parameter	Description
<b>3DES-CBC</b>	Use the check box to enable or disable the Triple Data Encryption Standard encryption algorithm with Cipher Block Chaining. The default is enabled.
<b>AES128-CBC</b>	Use the check box to enable or disable the Advanced Encryption Standard AES128 encryption algorithm with Cipher Block Chaining. The default is enabled.
<b>AES192-CBC</b>	Use the check box to enable or disable the Advanced Encryption Standard AES192 encryption algorithm with Cipher Block Chaining. The default is enabled.
<b>AES256-CBC</b>	Use the check box to enable or disable the Advanced Encryption Standard AES-256 encryption algorithm with Cipher Block Chaining. The default is enabled.
<b>Cast128-CBC</b>	Use the check box to enable or disable the Cast128 encryption algorithm with Cipher Block Chaining. The default is enabled.
<b>ARC4</b>	Use the check box to enable or disable the Arcfour encryption algorithm with Cipher Block Chaining. The default is enabled.
<b>Blow-fish CBC</b>	Use the check box to enable or disable the Blowfish encryption algorithm with Cipher Block Chaining. The default is enabled.
<b>Twofish128</b>	Use the check box to enable or disable the twofish128 encryption algorithm. The default is enabled.
<b>Twofish192</b>	Use the check box to enable or disable the twofish192 encryption algorithm. The default is enabled.
<b>Twofish256</b>	Use the check box to enable or disable the twofish256 encryption algorithm. The default is enabled.

Click the **Apply** button to accept the changes made.

The fields that can be configured for the **Data Integrity Algorithm** are described below:

Parameter	Description
<b>HMAC-MD5</b>	Use the check box to enable or disable the HMAC (Hash for Message Authentication Code) mechanism utilizing the MD5 Message Digest encryption algorithm. The default is enabled.
<b>HMAC-SHA1</b>	Use the check box to enable or disable the HMAC (Hash for Message Authentication Code) mechanism utilizing the Secure Hash algorithm. The default is enabled.

Click the **Apply** button to accept the changes made.

The fields that can be configured for the **Public Key Algorithm** are described below:

Parameter	Description
<b>HMAC-RSA</b>	Use the check box to enable or disable the HMAC (Hash for Message Authentication Code) mechanism utilizing the RSA encryption algorithm. The default is enabled.
<b>HMAC-DSA</b>	Use the check box to enable or disable the HMAC (Hash for Message Authentication Code) mechanism utilizing the Digital Signature Algorithm (DSA) encryption. The default is enabled.

Click the **Apply** button to accept the changes made.

## SSH User Authentication List

Users can configure parameters for users attempting to access the Switch through SSH. In the window above, the User Account "username" has been previously set using the **User Accounts** window in the **Configuration** folder. A User Account MUST be set in order to set the parameters for the SSH user.

To view this window, click **Security > SSH > SSH User Authentication List** as shown below:

The screenshot shows a software interface titled 'SSH User Authentication List'. At the top, it displays 'Total Entries: 1'. Below this, there is a table with four columns: 'User Name', 'Authentication Method', 'Host Name', and 'Host IP'. The first row contains the values 'admin', 'Password', ' ', and ' '. To the right of the table is an 'Edit' button. A note at the bottom states: 'Note: Maximum 8 entries and Host Name should be less than 33 characters.'

**Figure 8-81 SSH User Authentication List window**

The fields that can be configured or displayed are described below:

Parameter	Description
<b>User Name</b>	A name of no more than 15 characters to identify the SSH user. This User Name must be a previously configured user account on the Switch.
<b>Authentication Method</b>	The administrator may choose one of the following to set the authorization for users attempting to access the Switch. <i>Host Based</i> – This parameter should be chosen if the administrator wishes to use a remote SSH server for authentication purposes. Choosing this parameter requires the user to input the following information to identify the SSH user. <i>Password</i> – This parameter should be chosen if the administrator wishes to use an administrator-defined password for authentication. Upon entry of this parameter, the Switch will prompt the administrator for a password, and then to re-type the password for confirmation. <i>Public Key</i> – This parameter should be chosen if the administrator wishes to use the public key on a SSH server for authentication.
<b>Host Name</b>	Enter an alphanumeric string of no more than 32 characters to identify the remote SSH user. This parameter is only used in conjunction with the <i>Host Based</i> choice in the Auth. Mode field.
<b>Host IP</b>	Enter the corresponding IP address of the SSH user. This parameter is only used in conjunction with the <i>Host Based</i> choice in the Auth. Mode field.

Click the **Edit** button to re-configure the specific entry.

Click the **Apply** button to accept the changes made.

**NOTE:** To set the SSH User Authentication Mode parameters on the Switch, a User Account must be previously configured.

## DoS Attack Prevention Settings

On this page, the user can configure the prevention of each DoS attacks. The packet matching will be done by hardware. For a specific type of attack, the content of the packet will be matched against a specific pattern.

To view this window, click **Security > DoS Attack Prevention Settings** as shown below:

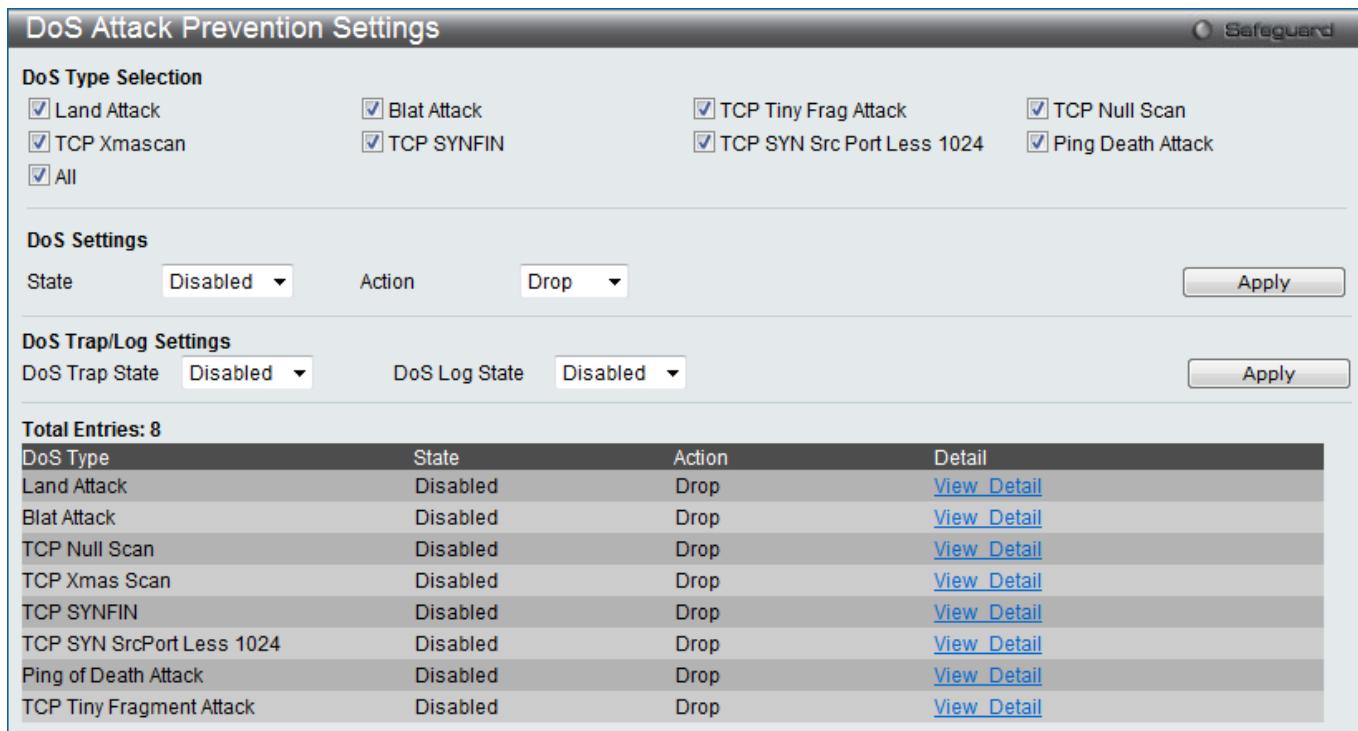

Figure 8-82 DoS Attack Prevention Settings window

The fields that can be configured or displayed are described below:

Parameter	Description
<b>DoS Type Selection</b>	Here the user can select the appropriate DoS Attack prevention types. <i>Land Attack</i> - Specifies that the DoS attack prevention type will be set to prevent LAND attacks. <i>Blat Attack</i> - Specifies that the DoS attack prevention type will be set to prevent BLAT attacks. <i>TCP Tiny Frag Attack</i> - Specifies that the DoS attack prevention type will be set to prevent TCP Tiny Frag attacks. <i>TCP Null Scan</i> - Specifies that the DoS attack prevention type will be set to prevent TCP Null Scan attacks. <i>TCP Xmas Scan</i> - Specifies that the DoS attack prevention type will be set to prevent TCP Xmas Scan attacks. <i>TCP SYNFIN</i> - Specifies that the DoS attack prevention type will be set to prevent TCP SYN FIN attacks. <i>TCP SYN Src Port Less 1024</i> - Specifies that the DoS attack prevention type will be set to prevent TCP SYN Source Port Less 1024 attacks. <i>Ping Death Attack</i> - Specifies that the DoS attack prevention type will be set to prevent Ping of Death attacks. all - Specifies that the DoS attack prevention type will be set to prevent all attacks.
<b>State</b>	Specifies the DoS Attack Prevention state. <i>Enable</i> - Specifies that the DoS Attack Prevention state will be enabled. <i>Disable</i> - Specifies that the DoS Attack Prevention state will be disabled.
<b>Action</b>	Specifies the action that the DoS Prevention function will take. <i>Drop</i> - Specifies to drop all matched DoS attack packets.
<b>DoS Trap State</b>	This option is used to enable or disable the DoS prevention trap state.

<b>DoS Log State</b>	This option is used to enable or disable the DoS prevention log state.
----------------------	--

Click the **Apply** button to accept the changes made.

After clicking the [View Detail](#) link next to the DoS Type displays, the following window will appear:

The screenshot shows a configuration window titled "DoS Attack Prevention Detail". It displays the following settings for a "Land Attack":

- DoS Type: Land Attack
- State: Disabled
- Action: Drop
- Frame Counts: -

A "Safeguard" icon is visible in the top right corner, and a "<<Back" button is located in the top right area of the window.

Figure 8-83 DoS Attack Prevention Detail window

Click the <<Back button to return to the previous page.

## Trusted Host Settings

Up to thirty trusted host secure IP addresses or ranges may be configured and used for remote Switch management. It should be noted that if one or more trusted hosts are enabled, the Switch will immediately accept remote instructions from only the specified IP address or addresses. If you enable this feature, be sure to first enter the IP address of the station you are currently using.

To view this window, click **Security > Trusted Host Settings** as shown below:

The screenshot shows the "Trusted Host Settings" configuration window. It includes fields for:

- IPv4 Address:  (e.g.: 255.255.255.254 or 1-32)
- IPv6 Address:  (1-128)
- Access Interface:  SNMP  Telnet  SSH  HTTP  HTTPS  Ping  All

Buttons for "Add" and "Delete All" are located at the bottom right. Below this, a table lists the total entries and their details:

Total Entries: 1	
IP Address	Access Interface
192.168.69.0/24	SNMP Telnet SSH HTTP HTTPS Ping

Buttons for "Edit" and "Delete" are located to the right of the table. A note at the bottom states: "Note: Create a list of IPv4 / IPv6 addresses that can access the switch. Your local host IPv4 / IPv6 address must be one of the IPv4 / IPv6 addresses to avoid disconnection."

**Figure 8-84 Trusted Host window**

When the user clicks the **Edit** button, one will be able to edit the service allowed to the selected host.

The fields that can be configured are described below:

Parameter	Description
<b>IPv4 Address</b>	Enter an IPv4 address to add to the trusted host list.
<b>IPv6 Address</b>	Enter an IPv6 address to add to the trusted host list.
<b>Net Mask</b>	Enter a Net Mask address to add to the trusted host list.
<b>Access Interface</b>	Tick the check boxes to select services that will be allowed to the trusted host.

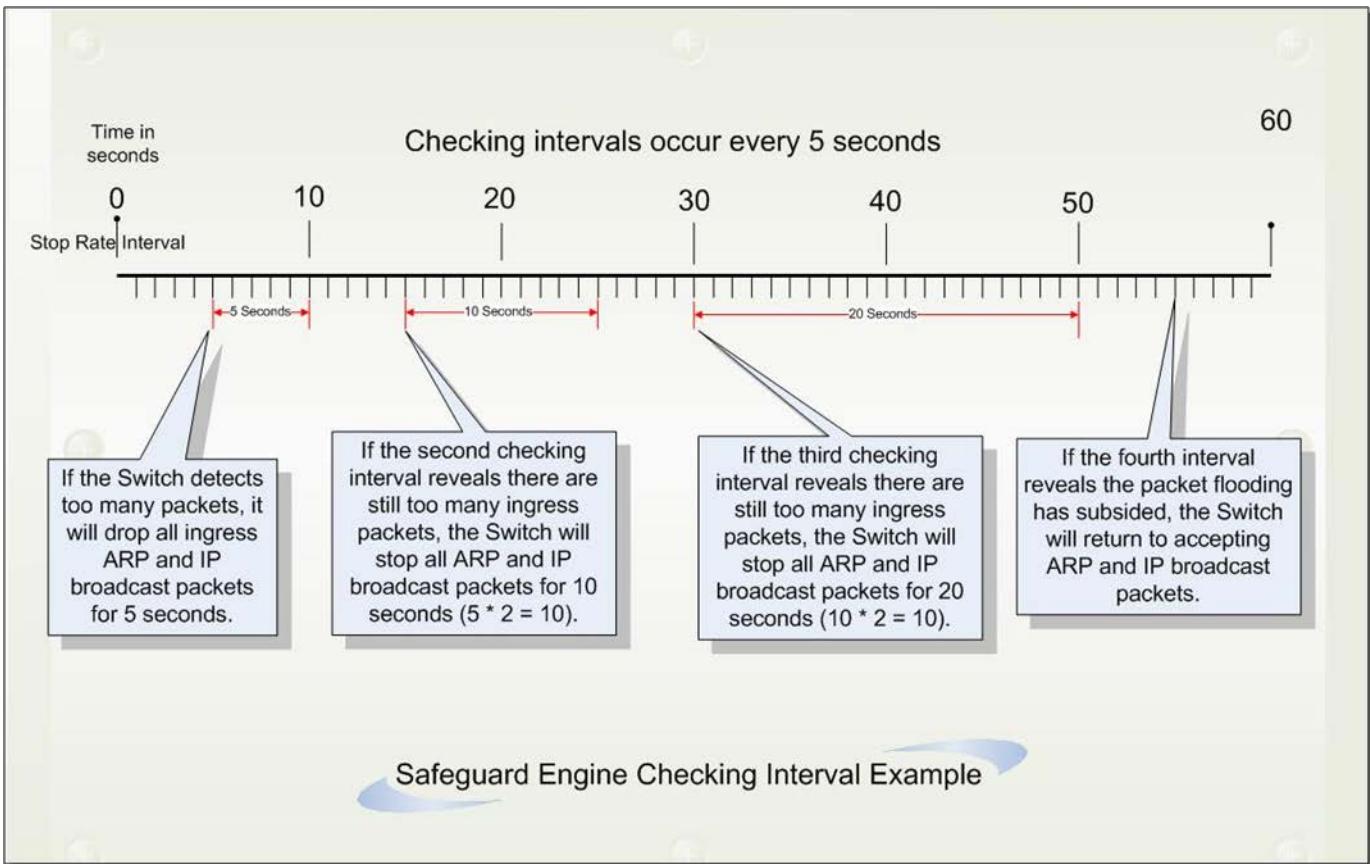

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

## Safeguard Engine Settings

Periodically, malicious hosts on the network will attack the Switch by utilizing packet flooding (ARP Storm) or other methods. These attacks may increase the switch load beyond its capability. To alleviate this problem, the Safeguard Engine function was added to the Switch's software.

The Safeguard Engine can help the overall operability of the Switch by minimizing the workload of the Switch while the attack is ongoing, thus making it capable to forward essential packets over its network in a limited bandwidth. The Safeguard Engine has two operating modes that can be configured by the user, *Strict* and *Fuzzy*. In *Strict* mode, when the Switch either (a) receives too many packets to process or (b) exerts too much memory, it will enter the *Exhausted* mode. When in this mode, the Switch will drop all ARP and IP broadcast packets and packets from un-trusted IP addresses for a calculated time interval. Every five seconds, the Safeguard Engine will check to see if there are too many packets flooding the Switch. If the threshold has been crossed, the Switch will initially stop all ingress ARP and IP broadcast packets and packets from un-trusted IP addresses for five seconds. After another five-second checking interval arrives, the Switch will again check the ingress flow of packets. If the flooding has stopped, the Switch will again begin accepting all packets. Yet, if the checking shows that there continues to be too many packets flooding the Switch, it will stop accepting all ARP and IP broadcast packets and packets from un-trusted IP addresses for double the time of the previous stop period. This doubling of time for stopping these packets will continue until the maximum time has been reached, which is 320 seconds and every stop from this point until a return to normal ingress flow would be 320 seconds. For a better understanding, please examine the following example of the Safeguard Engine.

**Figure 8-85 Mapping QoS on the Switch**

For every consecutive checking interval that reveals a packet flooding issue, the Switch will double the time it will discard ingress ARP and IP broadcast packets and packets from the illegal IP addresses. In the example above, the Switch doubled the time for dropping ARP and IP broadcast packets when consecutive flooding issues were detected at 5-second intervals. (First stop = 5 seconds, second stop = 10 seconds, third stop = 20 seconds) Once the flooding is no longer detected, the wait period for dropping ARP and IP broadcast packets will return to 5 seconds and the process will resume.

In Fuzzy mode, once the Safeguard Engine has entered the Exhausted mode, the Safeguard Engine will decrease the packet flow by half. After returning to Normal mode, the packet flow will be increased by 25%. The switch will then return to its interval checking and dynamically adjust the packet flow to avoid overload of the Switch.

**NOTICE:** When Safeguard Engine is enabled, the Switch will allot bandwidth to various traffic flows (ARP, IP) using the FFP (Fast Filter Processor) metering table to control the CPU utilization and limit traffic. This may limit the speed of routing traffic over the network.

Users can enable the Safeguard Engine or configure advanced Safeguard Engine settings for the Switch.

To view this window, click **Security > Safeguard Engine Settings** as shown below:

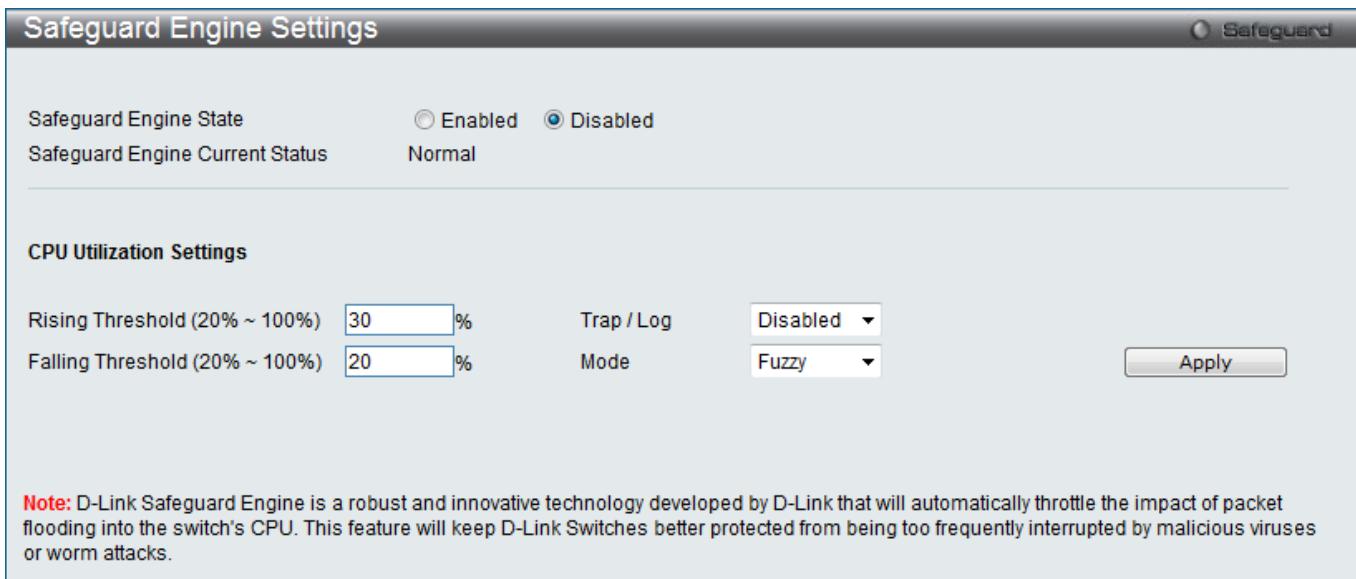

Figure 8-86 Safeguard Engine Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Safeguard Engine State</b>	Use the radio button to globally enable or disable Safeguard Engine settings for the Switch.
<b>Rising Threshold (20% - 100%)</b>	Used to configure the acceptable level of CPU utilization before the Safeguard Engine mechanism is enabled. Once the CPU utilization reaches this percentage level, the Switch will move into Exhausted mode, based on the parameters provided in this window.
<b>Falling Threshold (20% - 100%)</b>	Used to configure the acceptable level of CPU utilization as a percentage, where the Switch leaves the Safeguard Engine state and returns to normal mode.
<b>Trap / Log</b>	Use the drop-down menu to enable or disable the sending of messages to the device's SNMP agent and switch log once the Safeguard Engine has been activated by a high CPU utilization rate.
<b>Mode</b>	Used to select the type of Safeguard Engine to be activated by the Switch when the CPU utilization reaches a high rate. The user may select: <i>Fuzzy</i> – If selected, this function will instruct the Switch to minimize the IP and ARP traffic flow to the CPU by dynamically allotting an even bandwidth to all traffic flows. <i>Strict</i> – If selected, this function will stop accepting all ARP packets not intended for the Switch, and will stop receiving all unnecessary broadcast IP packets, until the storm has subsided. The default setting is <i>Fuzzy</i> mode.

Click the **Apply** button to accept the changes made.

## SFTP Server Settings

This window is used to enable, disable, and configure the SFTP function globally. SFTP over SSH2 is a remotely secure file transfer protocol providing security on all file operations. SFTP server runs as a subsystem of SSH server. SSH server is required to be enabled before enabling SFTP server.

To view this window, click **Security > SFTP Server Settings** as shown below:

**Figure 8-87 SFTP Server Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>SFTP Server State</b>	Select to enable or disable the SFTP server state here.
<b>Session Idle Timeout (30-600)</b>	Enter the SFTP server session idle timeout value used here. This value must be between 30 and 600 seconds. The default value is 120 seconds.

Click the **Apply** button to accept the changes made.

# Chapter 9 Network Application

**DHCP****DNS****DNS Resolver****RCP Server Settings****SMTP Settings****SNTP****UDP****Flash File System Settings**

## DHCP

### DHCP Relay

#### DHCP Relay Global Settings

Users can enable and configure DHCP Relay Global Settings. The relay hops count limit allows the maximum number of hops (routers) that the DHCP messages can be relayed through to be set. The DHCP packet will be dropped when the relay hop count in the received packet is equal to or greater than this setting. The range is between 1 and 16 hops, with a default value of 4. The relay time threshold sets the minimum time (in seconds) that the Switch will wait before forwarding a BOOTREQUEST packet. If the value in the seconds' field of the packet is less than the relay time threshold, the packet will be dropped. The range is between 0 and 65,535 seconds, with a default value of 0 seconds.

To view this window, click **Network Application > DHCP > DHCP Relay > DHCP Relay Global Settings** as shown below:

**Figure 9-1** DHCP Relay Global Settings window

The fields that can be configured are described below:

Parameter	Description
<b>DHCP Relay State</b>	This field can be toggled between <i>Enabled</i> and <i>Disabled</i> using the drop-down menu. It is used to enable or disable the DHCP Relay service on the Switch. The default is <i>Disabled</i> .

<b>DHCP Relay Hops Count Limit (1-16)</b>	This field allows an entry between 1 and 16 to define the maximum number of router hops DHCP messages can be forwarded. The default hop count is 4.
<b>DHCP Relay Time Threshold (0-65535)</b>	Allows an entry between 0 and 65535 seconds, and defines the maximum time limit for routing a DHCP packet. If a value of 0 is entered, the Switch will not process the value in the seconds' field of the DHCP packet. If a non-zero value is entered, the Switch will use that value, along with the hop count to determine whether to forward a given DHCP packet.
<b>DHCP Relay Option 82 State</b>	<p>This field can be toggled between <i>Enabled</i> and <i>Disabled</i> using the drop-down menu. It is used to enable or disable the DHCP Relay Agent Information Option 82 on the Switch. The default is <i>Disabled</i>.</p> <p><i>Enabled</i> – When this field is toggled to <i>Enabled</i>, the relay agent will insert and remove DHCP relay information (option 82 field) in messages between DHCP servers and clients. When the relay agent receives the DHCP request, it adds the option 82 information, and the IP address of the relay agent (if the relay agent is configured), to the packet. Once the option 82 information has been added to the packet it is sent on to the DHCP server. When the DHCP server receives the packet, if the server is capable of option 82, it can implement policies like restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. Then the DHCP server echoes the option 82 field in the DHCP reply. The DHCP server unicasts the reply back to the relay agent if the request was relayed to the server by the relay agent. The switch verifies that it originally inserted the option 82 data. Finally, the relay agent removes the option 82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request.</p> <p><i>Disabled</i> – When the field is toggled to <i>Disabled</i>, the relay agent will not insert and remove DHCP relay information (option 82 field) in messages between DHCP servers and clients, and the check and policy settings will have no effect.</p>
<b>DHCP Relay Agent Information Option 82 Check</b>	<p>This field can be toggled between <i>Enabled</i> and <i>Disabled</i> using the drop-down menu. It is used to enable or disable the Switch's ability to check the validity of the packet's option 82 field.</p> <p><i>Enabled</i> – When the field is toggled to <i>Enabled</i>, the relay agent will check the validity of the packet's option 82 field. If the Switch receives a packet that contains the option 82 field from a DHCP client, the Switch drops the packet because it is invalid. In packets received from DHCP servers, the relay agent will drop invalid messages.</p> <p><i>Disabled</i> – When the field is toggled to <i>Disabled</i>, the relay agent will not check the validity of the packet's option 82 field.</p>
<b>DHCP Relay Agent Information Option 82 Policy</b>	<p>This field can be toggled between <i>Replace</i>, <i>Drop</i>, and <i>Keep</i> by using the drop-down menu. It is used to set the Switch's policy for handling packets when the DHCP Relay Agent Information Option 82 Check is set to <i>Disabled</i>. The default is <i>Replace</i>.</p> <p><i>Replace</i> – The option 82 field will be replaced if the option 82 field already exists in the packet received from the DHCP client.</p> <p><i>Drop</i> – The packet will be dropped if the option 82 field already exists in the packet received from the DHCP client.</p> <p><i>Keep</i> – The option 82 field will be retained if the option 82 field already exists in the packet received from the DHCP client.</p>
<b>DHCP Relay Agent Information Option 82 Remote ID</b>	Enter the DHCP Relay Agent Information Option 82 Remote ID.
<b>DHCP Relay Option 60 State</b>	Use the drop-down menu to enable or disable the use of the DHCP Relay Option 60 State feature.
<b>DHCP Relay Option 61 State</b>	Use the drop-down menu to enable or disable the use of the DHCP Relay Option 61 State feature.

Click the **Apply** button to accept the changes made for each individual section.

**NOTE:** If the Switch receives a packet that contains the option 82 field from a DHCP client and the information-checking feature is enabled, the Switch drops the packet because it is invalid. However, in some instances, users may configure a client with the option 82 field. In this situation, disable the information check feature so that the Switch does not drop the option 82 field from the packet. Users may configure the action that the Switch takes when it receives a packet with existing option 82 information by configuring the DHCP Agent Information Option 82 Policy.

### The Implementation of DHCP Relay Agent Information Option 82

The **DHCP Relay Option 82** command configures the DHCP relay agent information option 82 setting of the Switch. The formats for the circuit ID sub-option and the remote ID sub-option are as follows:

**NOTE:** For the circuit ID sub-option of a standalone switch, the module field is always zero.

#### Circuit ID sub-option format:

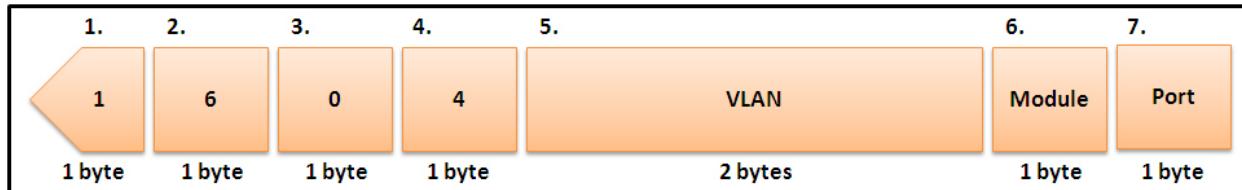

Figure 9-2 Circuit ID Sub-option Format

- 1 Sub-option type
- 2 Length
- 3 Circuit ID type
- 4 Length
- 5 VLAN: The incoming VLAN ID of DHCP client packet.
- 6 Module: For a standalone switch, the Module is always 0; for a stackable switch, the Module is the Unit ID.
- 7 Port: The incoming port number of the DHCP client packet, the port number starts from 1.

#### Remote ID sub-option format:

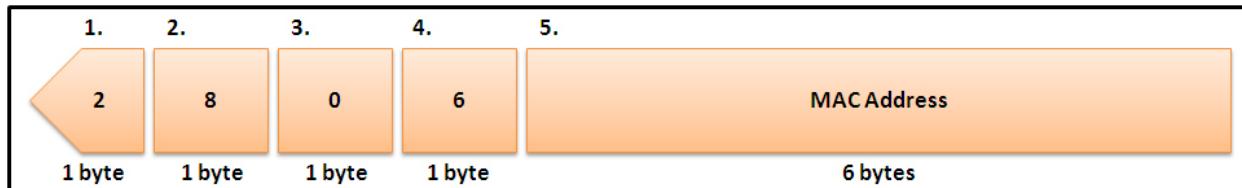

Figure 9-3 Remote ID Sub-option Format

- 1 Sub-option type
- 2 Length
- 3 Remote ID type
- 4 Length
- 5 MAC address: The Switch's system MAC address.

## DHCP Relay Interface Settings

Users can set up a server, by IP address, for relaying DHCP information to the Switch. The user may enter a previously configured IP interface on the Switch that will be connected directly to the DHCP client using this window. Properly configured settings will be displayed in the DHCP Relay Interface Table at the bottom of the window, once the user clicks the **Apply** button. The user may add up to four server IPs per IP interface on the Switch. Entries may be deleted by clicking the corresponding **Delete** button.

To view this window, click **Network Application > DHCP > DHCP Relay > DHCP Relay Interface Settings** as shown below:

DHCP Relay Interface Settings					Safeguard	
Interface Name	<input type="text"/>	(Max: 12 characters)			<input type="button" value="Apply"/>	
Server IP Address	<input type="text"/>	(e.g.: 10.90.90.90)				
<b>Total Entries: 1</b>						
Interface Name	Server1	Server2	Server3	Server4		
System	10.90.90.90	<input type="button" value="Delete"/>	0.0.0.0	<input type="button" value="Delete"/>	0.0.0.0	<input type="button" value="Delete"/>

Figure 9-4 DHCP Relay Interface Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	The IP interface on the Switch that will be connected directly to the client.
<b>Server IP Address</b>	Enter the IP address of the DHCP server. Up to four server IPs can be configured per IP Interface.

Click the **Apply** button to accept the changes made.

## DHCP Relay Option 60 Server Settings

The DHCP Option 60 is a Vendor class identifier. If this feature is enabled, the Switch will check the Option 60 from the DHCP client and then decide to which DHCP server it should be forwarded to. The forwarding rule can be configured in this Switch. On this page the user can configure the DHCP relay Option 60 server parameters.

To view this window, click **Network Application > DHCP > DHCP Relay > DHCP Relay Option 60 Server Settings** as shown below:

DHCP Relay Option 60 Server Settings					Safeguard
Server IP Address	<input type="text"/>	(e.g.: 10.90.90.90)			<input type="button" value="Add"/>
Mode	<input type="button" value="Drop"/>				<input type="button" value="Apply"/>
Server1	Server2	Server3	Server4		
10.90.90.90	<input type="button" value="Delete"/>	0.0.0.0	<input type="button" value="Delete"/>	0.0.0.0	<input type="button" value="Delete"/>

Figure 9-5 DHCP Relay Option 60 Server Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Server IP Address</b>	Enter the DHCP Relay Option 60 Server Relay IP Address.
<b>Mode</b>	Use the drop-down menu to select the DHCP Relay Option 60 Server mode.

Click the **Add** button to add a new entry based on the information entered.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specific entry.

Click the **Delete All** button to remove all the entries listed.

**NOTE:** When there is no matching server found for the packet based on option 60, the relay servers will be determined by the default relay server setting.

## DHCP Relay Option 60 Settings

This option decides whether the DHCP Relay will process the DHCP option 60 or not

To view this window, click **Network Application > DHCP > DHCP Relay > DHCP Relay Option 60 Settings** as shown below:

DHCP Relay Option 60 Settings		Safeguard
String	<input type="text"/>	(Max: 255 characters)
Server IP Address	<input type="text"/>	(e.g.: 10.90.90.90)
Match Type	Exact Match	<input type="button" value="Add"/>
<input type="button" value="IP Address"/> <input type="text"/>		<input type="button" value="Find"/> <input type="button" value="Delete"/>
<input type="button" value="Show All"/> <input type="button" value="Delete All"/>		
Total Entries: 0		
String	Match Type	IP Address

Figure 9-6 DHCP Relay Option 60 Settings window

The fields that can be configured are described below:

Parameter	Description
<b>String</b>	Enter the DHCP Relay Option 60 String value. Different strings can be specified for the same relay server, and the same string can be specified with multiple relay servers. The system will relay the packet to all the matching servers.
<b>Server IP Address</b>	Enter the DHCP Relay Option 60 Server IP address.
<b>Match Type</b>	Enter the DHCP Relay Option 60 Match Type value. <i>Exact Match</i> – The option 60 string in the packet must full match with the specified string. <i>Partial Match</i> – The option 60 string in the packet only need partial match with the specified string.
<b>IP Address</b>	Enter the DHCP Relay Option 60 IP address.
<b>String</b>	Enter the DHCP Relay Option 60 String value.

Click the **Add** button to add a new entry based on the information entered.

- Click the **Find** button to locate a specific entry based on the information entered.
- Click the **Delete** button to remove the specific entry based on the information entered.
- Click the **Show All** button to display all the existing entries.
- Click the **Delete All** button to remove all the entries listed.
- Click the **Delete** button to remove the specific entry.

## DHCP Relay Option 61 Settings

If this feature is enabled, the Switch will check the Option 61 from the DHCP client and then decide to forward a specific server or to drop it, according to the Option 61 ruler configured by administrator. On this page the user can configure, add and delete DHCP relay option 61 parameters.

To view this window, click **Network Application > DHCP > DHCP Relay > DHCP Relay Option 61 Settings** as shown below:

Figure 9-7 DHCP Relay Option 61 Settings window

The fields that can be configured are described below:

Parameter	Description
<b>DHCP Relay Option 61 Default</b>	Here the user can select the DHCP Relay Option 61 default action. <i>Drop</i> – Specify to drop the packet. <i>Relay</i> – Specify to relay the packet to an IP address. Enter the IP Address of the default relay server. When there is no matching server found for the packet based on option 61, the relay servers will be determined by this default relay server setting.
<b>Client ID</b>	<i>MAC Address</i> – The client's client-ID which is the hardware address of client. <i>String</i> – The client's client-ID, which is specified by administrator.
<b>Relay Rule</b>	<i>Drop</i> – Specify to drop the packet. <i>Relay</i> – Specify to relay the packet to an IP address.
<b>Client ID</b>	<i>MAC Address</i> – The client's client-ID which is the hardware address of client. <i>String</i> – The client's client-ID, which is specified by administrator.

Click the **Apply** button to accept the changes made.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

## DHCP Relay Port Settings

This window is used to configure the state of the DHCP relay function for each port.

To view this window, click **Network Application > DHCP > DHCP Relay > DHCP Relay Port Settings** as shown below:

The screenshot shows the 'DHCP Relay Port Settings' window. At the top, there are dropdown menus for 'Unit' (set to 1), 'From Port' (set to 01), 'To Port' (set to 01), and 'State' (set to Enabled). An 'Apply' button is located to the right of the dropdowns. Below this, a table titled 'Unit 1 Settings' displays the configuration for 24 ports. The table has columns for 'Port' (numbered 1 to 24) and 'State' (all set to 'Enabled').

Port	State
1	Enabled
2	Enabled
3	Enabled
4	Enabled
5	Enabled
6	Enabled
7	Enabled
8	Enabled
9	Enabled

18	Enabled
19	Enabled
20	Enabled
21	Enabled
22	Enabled
23	Enabled
24	Enabled

Figure 9-8 DHCP Relay Port Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select the range of port, used for this configuration, here.
<b>State</b>	Select to enable or disable the DHCP relay port settings state.

Click the **Apply** button to accept the changes made.

## DHCP Server

DHCP, or Dynamic Host Configuration Protocol, allows the switch to delegate IP addresses, subnet masks, default gateways and other IP parameters to devices that request this information. This occurs when a DHCP enabled device is booted on or attached to the locally attached network. This device is known as the DHCP client and when enabled, it will emit query messages on the network before any IP parameters are set. When the DHCP server receives this request, it returns a response to the client, containing the previously mentioned IP information that the DHCP client then utilizes and sets on its local configurations.

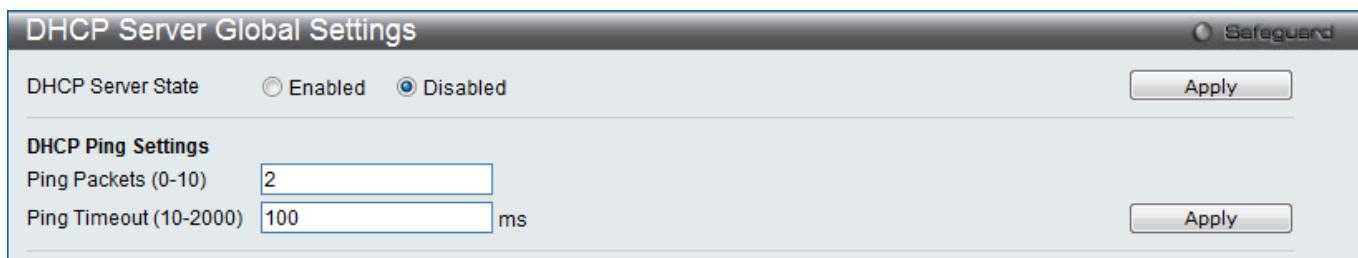

The user can configure many DHCP related parameters that it will utilize on its locally attached network, to control and limit the IP settings of clients desiring an automatic IP configuration, such as the lease time of the allotted IP address, the range of IP addresses that will be allowed in its DHCP pool, the ability to exclude various IP addresses within the pool so as not to make identical entries on its network, or to assign the IP address of an important device (such as a DNS server or the IP address of the default route) to another device on the network.

Users also have the ability to bind IP addresses within the DHCP pool to specific MAC addresses in order to keep consistent the IP addresses of devices that may be important to the upkeep of the network that require a static IP address.

## DHCP Server Global Settings

This window is used to configure the DHCP server global parameters.

To view this window, click **Network Application > DHCP > DHCP Server > DHCP Server Global Settings** as shown below:

**Figure 9-9 DHCP Server Global Settings Window**

The fields that can be configured are described below:

Parameter	Description
<b>DHCP Server State</b>	Click the radio buttons to enable or disable the DHCP Server State.
<b>Ping Packets (0-10)</b>	Enter the numbers of ping packet that the Switch will send out on the network containing the IP address to be allotted. If the ping request is not returned, the IP address is considered unique to the local network and then allotted to the requesting client. 0 means there is no ping test. The default value is 2.
<b>Ping Timeout (10-2000)</b>	Enter the amount of time the DHCP server must waits before timing out a ping packet. The default value is 100.

Click the **Apply** button to accept the changes made for each individual section.

## DHCP Server Exclude Address Settings

The DHCP server assumes that all IP addresses in a DHCP pool subnet are available for assigning to DHCP clients. You must use this page to specify the IP address that the DHCP server should not assign to clients. This command can be used multiple times in order to define multiple groups of excluded addresses.

To view this window, click **Network Application > DHCP > DHCP Server > DHCP Server Exclude Address Settings** as shown below:

The screenshot shows the 'DHCP Server Exclude Address Settings' window. At the top, there's a section for 'Add DHCP Excluded Address' with 'Begin Address' and 'End Address' input fields and 'Add' and 'Delete All' buttons. Below this is a table titled 'Total Entries: 1' showing one entry: Index 1, Begin Address 192.168.69.5, End Address 192.168.69.10, with a 'Delete' button.

Total Entries: 1			
Index	Begin Address	End Address	
1	192.168.69.5	192.168.69.10	<b>Delete</b>

Figure 9-10 DHCP Server Exclude Address Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>Begin Address</b>	Enter the starting IP Address.
<b>End Address</b>	Enter the ending IP Address.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

Click the **Delete** button to remove the specific entry.

## DHCP Server Pool Settings

This window is used to add and delete the DHCP server pool.

To view this window, click **Network Application > DHCP > DHCP Server > DHCP Server Pool Settings** as shown below:

The screenshot shows the 'DHCP Server Pool Settings' window. At the top, there's a section for 'Add DHCP Pool' with 'Pool Name' and 'Add' buttons, and a 'Delete All' button. Below this is a table titled 'Total Entries: 1' showing one entry: Pool Name DPool, with 'Edit Class', 'Edit', and 'Delete' buttons.

Total Entries: 1				
Pool Name		Edit Class	Edit	Delete
DPool				

Figure 9-11 DHCP Server Pool Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>Pool Name</b>	Enter the DHCP Server Pool name.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

After clicking the **Edit** button, the following page will appear:

DHCP Server Pool Settings

Safeguard

Pool Name	pool
IP Address	<input type="text"/>
Netmask	<input type="text"/> (e.g.: 255.255.255.254 or 8-32)
NetBIOS Node Type	Broadcast
Domain Name	<input type="text"/> (Max: 64 characters)
Boot File	<input type="text"/> (Max: 64 characters)
Next Server	<input type="text"/> (e.g.: 10.90.90.90)
DNS Server Address	<input type="text"/> <input type="text"/> <input type="text"/> (e.g.: 10.90.90.90)
NetBIOS Name Server	<input type="text"/> <input type="text"/> <input type="text"/> (e.g.: 10.90.90.91)
Default Router	<input type="text"/> <input type="text"/> <input type="text"/> (e.g.: 10.90.90.92)
Pool Lease	1 Days 00 Hours 00 Minutes <input type="checkbox"/> Infinite
Option 43	<input type="text"/> (Max: 255 characters) <input type="button" value="Apply"/>
Action	Add <input type="button" value="Apply"/>
Option Profile	Please Select <input type="button" value="Apply"/>

<< Back

Figure 9-12 DHCP Server Pool Settings (Edit) Window

The fields that can be configured are described below:

Parameter	Description
<b>IP Address</b>	Enter the network address of the pool.
<b>Netmask</b>	Enter the Netmask for the network address.
<b>NetBIOS Node Type</b>	NetBIOS node type for a Microsoft DHCP client.
<b>Domain Name</b>	Domain name of client. The domain name configured here will be used as the default domain name by the client.
<b>Boot File</b>	File name of boot image. The boot file is used to store the boot image for the client. The boot image is generally the operating system the client uses to load. If this option is input twice for the same pool, the second command will overwrite the first command. If the boot file is not specified, the boot file information will not be provided to the client.
<b>Next Server</b>	Enter the next server IP address.
<b>DNS Server Address</b>	IP address of DNS server. Specifies the IP address of a DNS server that is available to a DHCP client. Up to three IP addresses can be specified in one command line.
<b>NetBIOS Name Server</b>	IP address of WINS server. Windows Internet Naming Service (WINS) is a name resolution service that Microsoft DHCP clients use to correlate host names to IP addresses within a general grouping of networks. Up to three IP addresses can be specified in one command line.
<b>Default Router</b>	IP address of default router. Specifies the IP address of the default router for a DHCP client. Up to three IP addresses can be specified in one command line.

<b>Pool Lease</b>	By default, each IP address assigned by a DHCP server comes with a one-day lease, which is the amount of time that the address is valid. Tick the <b>Infinite</b> check box to have infinite lease. <i>Days</i> – Days of lease. <i>Hours</i> – Hours of lease. <i>Minutes</i> – Minutes of lease
<b>Option 43</b>	This option is used to add or delete DHCP Option 43. The DHCP server may contain this option in the DHCP reply according to Option 55 in the client's request packet. Enter the DHCP Option 43 string used here.
<b>Action</b>	Select the Option profile action that will be taken. Options to choose from are <b>Add</b> and <b>Delete</b> .
<b>Option Profile</b>	Select the Option profile that will be associated with this DHCP server pool.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

After clicking the **Edit Class** button, the following page will appear:

The screenshot shows the 'DHCP Server Pool Class Settings' window. At the top, there are fields for 'Pool Name' (DPool) and 'Class Name' (DClass). Below these are 'Begin Address' and 'End Address' fields, both set to 192.168.69... (e.g.: 20.0.0.20). At the bottom, a table lists the entry: 'Total Entries: 1'. The table has columns for 'Class Name', 'Begin Address', and 'End Address', with the value 'DClass' in the first column and '192.168.69...' in the second and third columns. Buttons for '<<Back' and 'Add' are visible at the bottom right.

Figure 9-13 DHCP Server Pool Settings (Edit Class) Window

The fields that can be configured are described below:

Parameter	Description
<b>Class Name</b>	Enter the DHCP class's name used here. This name can be up to 12 characters long.
<b>Begin Address</b>	Enter the beginning IP address used for the DHCP pool here.
<b>End Address</b>	Enter the ending IP address used for the DHCP pool here.

Click the **Add** button to add a new entry based on the information entered.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete By Name** button to remove the specific entry based on the name.

Click the **Delete By Address** button to remove the specific entry based on the address.

## DHCP Server Class Settings

On this page, the user can configure the DHCP server class settings.

To view this window, click **Network Application > DHCP > DHCP Server > DHCP Server Class Settings** as shown below:

Figure 9-14 DHCP Server Class Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Class State</b>	Specifies the DHCP Server Class' state here. <i>Enable</i> - Specifies that the DHCP Server Class feature will be enabled. <i>Disable</i> - Specifies that the DHCP Server Class feature will be disabled.
<b>Class Name</b>	Enter the DHCP class name used here. This name can be up to 12 characters long.
<b>Option</b>	Enter the Option type that will be associated with this DHCP server class. Options to choose from are <b>60</b> and <b>82</b> .
<b>Type</b>	Select and enter the type variable linked to this class here. Options to choose from, prior to the textbox, are <b>String</b> and <b>Hex</b> .

Click the **Apply** button to accept the changes made.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry.

Click the [View Detail](#) link to view more details regarding the specific entry.

After clicking the [View Detail](#) link, the following window will appear:

Figure 9-15 DHCP Server Class Settings window (View Details)

The fields that can be configured are described below:

Parameter	Description
-----------	-------------

<b>Class Name</b>	Displays the DHCP class name used here.
<b>Option</b>	Specifies the Option index that will be added. Options to choose from are 60 and 82.
<b>Type</b>	<p>Specifies the DHCP class string or HEX type used.</p> <p><i>String</i> - Enter the character string used here. This string can be up to 255 characters long.</p> <p><i>Hex</i> - Enter the hexadecimal value of the string used here. This value can be up to 255 characters long.</p>

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## DHCP Server Option Profile Settings

Here user can create and configure custom DHCP server option profiles.

To view this window, click **Network Application > DHCP > DHCP Server > DHCP Server Option Profile Settings** as shown below:

Add DHCP Server Option Profile	
Profile Name	<input type="text" value="OptionP1"/> (Max: 12 characters)
<b>Add</b>	

Add DHCP Server Option Profile Option	
Profile Name	OptionP1
Option	<input type="text" value="1-254"/>
Value Type	String
Value	<input type="text" value=""/> (Max: 255 characters)
<b>Add</b>	

Total Entries: 1	
Profile Name	OptionP1
Option	<a href="#">View Detail</a>
<b>Delete</b>	

Figure 9-16 DHCP Server Option Profile Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Option Profile Name</b>	Enter the new DHCP server Option profile name used here.
<b>Profile Name</b>	After creating a new DHCP server Option profile (above), the available profiles will be listed here for selection.
<b>Option</b>	Enter the custom DHCP server Option value used here.
<b>Value Type</b>	Select the value type used here. Options to choose from are <b>String</b> and <b>Hex</b> .
<b>Value</b>	Enter the option value here.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry.

Click the [View Detail](#) link to view more details regarding the specific entry.

After clicking the [View Detail](#) link, the following window will appear:

DHCP Server Option Profile Detail Settings			
<<Back		Total Entries: 1	
Class Name	Option	Type	Value
OptionP1	82	string	Option82
			<input type="button" value="Edit"/> <input type="button" value="Delete"/>

Figure 9-17 DHCP Server Option Profile Settings window (View Details)

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## DHCP Server Manual Binding

An address binding is a mapping between the IP address and MAC address of a client. The IP address of a client can be assigned manually by an administrator or assigned automatically from a pool by a DHCP server. The dynamic binding entry will be created when an IP address is assigned to the client from the pool network's address.

To view this window, click **Network Application > DHCP > DHCP Server > DHCP Server Manual Binding** as shown below:

DHCP Server Manual Binding			
Add DHCP Server Manual Binding			
Pool Name	<input type="text"/>	(Max: 12 characters)	IP Address <input type="text"/> (e.g.: 1.1.1.1)
Hardware Address	<input type="text"/> (e.g.: 00-00-00-00-00-01)	Type <input type="button" value="Ethernet"/>	<input type="button" value="Add"/>
Pool Name	<input type="text"/>	<input type="button" value="Delete All"/>	
Total Entries: 1			
Pool Name	IP Address	Hardware Address	Type
DPool	192.168.69.14	00-11-22-00-11-22	Ethernet <input type="button" value="Delete"/>

Figure 9-18 DHCP Server Manual Binding Window

The fields that can be configured are described below:

Parameter	Description
Pool Name	Enter the DHCP Server Pool name.
IP Address	IP address which will be assigned to specified client.
Hardware Address	Enter the hardware address.
Type	Either Ethernet or IEEE802 can be specified.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

Click the **Delete** button to remove the specific entry.

## DHCP Server Dynamic Binding

This window is used to delete the DHCP server dynamic binding table.

To view this window, click **Network Application > DHCP > DHCP Server > DHCP Server Dynamic Binding** as shown below:

DHCP Server Dynamic Binding

Pool Name  (Max: 12 characters)

Total Entries: 0

Pool Name	IP Address	Hardware Address	Type	Status	Lifetime (sec)
-----------	------------	------------------	------	--------	----------------

Figure 9-19 DHCP Server Dynamic Binding Window

The fields that can be configured are described below:

Parameter	Description
<b>Pool Name</b>	Enter the DHCP Server Pool name.

Click the **Clear** button to clear all the information entered in the fields.

Click the **Clear All** button to remove all the entries listed in the table.

## DHCP Conflict IP

The DHCP server will use PING packet to determine whether an IP address is conflict with other host before binding this IP. The IP address which has been identified conflict will be moved to the conflict IP database. The system will not attempt to bind the IP address in the conflict IP database unless the user clears it from the conflict IP database.

To view this window, click **Network Application > DHCP > DHCP Server > DHCP Conflict IP** as shown below:

DHCP Conflict IP

Total Entries: 0

IP Address	Detection Method	Detection Time
------------	------------------	----------------

Figure 9-20 DHCP Conflict IP Window

Click the **Clear All** button to remove all the entries listed in the table.

## DHCPv6 Server

### DHCPv6 Server Global Settings

This command is used to enable the DHCPv6 server function on the Switch

To view this window, click **Network Application > DHCP > DHCPv6 Server > DHCPv6 Server Global Settings** as shown below:

DHCPv6 Server Global Settings

DHCPv6 Server Global State  Enabled  Disabled

**Figure 9-21 DHCPv6 Server Global Settings window**

The fields that can be configured are described below:

Parameter	Description
DHCPv6 Server Global State	Click the radio buttons to enable or disable the DHCPv6 Server State.

Click the **Apply** button to accept the changes made.

## DHCPv6 Server Pool Settings

This window is used to create and configure a DHCPv6 pool.

To view this window, click **Network Application > DHCP > DHCPv6 Server > DHCPv6 Server Pool Settings** as shown below:

The screenshot shows the 'DHCPv6 Server Pool Settings' window. At the top, there is a search bar labeled 'Pool Name' with a placeholder '(Max: 12 characters)' and buttons for 'Add', 'Find', 'Delete All', and 'View All'. Below the search bar, it says 'Total Entries: 1'. A table lists one entry: 'Pool Name' is 'Pool', 'Begin Network Address' is '2001::1000', 'End Network Address' is '2001::1001', 'Excluded Address' is empty, 'Manual Binding' is empty, and 'Pool' is selected. There are 'Edit' and 'Delete' buttons for this row.

**Figure 9-22 DHCPv6 Server Pool Settings window**

The fields that can be configured are described below:

Parameter	Description
Pool Name	Enter the DHCPv6 Server Pool name.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

Click the **View All** button to display all the existing entries.

Click the **Edit** button under various columns to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

Click the **Edit** button under **Excluded Address** to see the following window.

The screenshot shows the 'DHCPv6 Server Excluded Address Settings' window. It has fields for 'Pool Name' (dhcpv6pool), 'Begin Address' (2233::1), and 'End Address' (2233::2). Below these, it says 'Total Entries: 1'. A table shows one entry: 'Range' is '1', 'Begin Address' is '2233::1', and 'End Address' is '2233::2'. There are 'Add', '<<Back', 'Delete All', and 'Delete' buttons.

**Figure 9-23 DHCPv6 Server Excluded Address Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Begin Address</b>	Enter the beginning IPv6 address of the range of IPv6 addresses to be excluded from the DHCPv6 pool.
<b>End Address</b>	Enter the ending IPv6 address of the range of IPv6 addresses to be excluded from the DHCPv6 pool.

Click the **Add** button to add a new entry based on the information entered.

Click the **<<Back** button to return to the previous window.

Click the **Delete All** button to remove all the entries listed.

Click the **Delete** button to remove the specific entry.

Click the **Edit** button under **Manual Binding** to see the following window.

DHCPv6 Server Manual Binding Settings	
Pool Name	Pool
<input checked="" type="radio"/> IPv6 Address	<input type="text"/> (e.g.: 2233::1)
<input type="radio"/> Network Address	<input type="text"/> (e.g.: 2233::/64)
Client DUID	<input type="text"/> (Max: 28 characters)
<input type="button" value="Add"/> <input type="button" value="&lt;&lt;Back"/> <input type="button" value="Delete All"/>	
<b>Total Entries: 0</b> Entry      IPv6 Address/Network Address      Identifier (DUID)	

Figure 9-24 DHCPv6 Server Manual Binding Settings window

The fields that can be configured are described below:

Parameter	Description
<b>IPv6 Address</b>	Enter the IPv6 address to be statically bound to a device.
<b>Network Address</b>	Enter the IPv6 networks address that will be statically bound to a device here.
<b>Client DUID</b>	Enter the DUID of the device to be statically bound to the IPv6 address entered in the previous field.

Click the **Add** button to add a new entry based on the information entered.

Click the **<<Back** button to return to the previous window.

Click the **Delete All** button to remove all the entries listed.

Click the **Delete** button to remove the specific entry.

Click the **Edit** button under **Pool** to see the following window.

DHCPv6 Server Pool Settings

Pool Name	Pool
<input checked="" type="radio"/> Begin Network Address	<input type="text"/> (e.g.: 2233::1/64)
<input type="radio"/> End Network Address	<input type="text"/> (e.g.: 2233::2/64)
Network Address	<input type="text"/> (e.g.: 2233::/64)
<input type="radio"/> Assigned Len	<input type="text"/>
Interface Name	<input type="text"/> (Max: 12 characters)
Domain Name	<input type="text"/> (Max: 255 characters)
DNS Server	<input type="text"/> <input type="text"/> (e.g.: 2233::1)
Preferred Lifetime (60-4294967295)	604800 sec
Valid Lifetime (60-4294967295)	2592000 sec

[\*\*<< Back\*\*](#) [\*\*Apply\*\*](#)

Figure 9-25 DHCPv6 Server Pool Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Begin Network Address</b>	Enter the beginning IPv6 network address of the DHCPv6 pool.
<b>End Network Address</b>	Enter the ending IPv6 network address of the DHCPv6 pool.
<b>Network Address</b>	Enter the IPv6 network address of the DHCPv6 pool.
<b>Assigned Len</b>	Enter the assigned length value here.
<b>Interface Name</b>	Enter the interface name used here.
<b>Domain Name</b>	The domain name is used by client when resolving hostnames with DNS.
<b>DNS Server</b>	Enter the DNS server IPv6 address for this pool. Users may specify up to two DNS server addresses.
<b>Preferred Lifetime (60-4294967295)</b>	The amount of time (in seconds) that the IPv6 address, based on the specified pool, remains in preferred state.
<b>Valid Lifetime (60-4294967295)</b>	The amount of time (in seconds) that the IPv6 address, based on the specified pool, remains in valid state.

Click the **<< Back** button to return to the previous window.

Click the **Apply** button to accept the changes made.

## DHCPv6 Server Dynamic Binding

This window is used to show the DHCPv6 dynamic binding information.

To view this window, click **Network Application > DHCP > DHCPv6 Server > DHCPv6 Server Dynamic Binding** as shown below:

DHCPv6 Server Dynamic Binding Table				
Pool Name	(Max: 12 characters)	Clear	Find	
<b>Total Entries: 0</b>				<b>Clear All</b> <b>View All</b>
Pool Name	IPv6 Address/Network Address	DUID	Preferred (sec)	Valid (sec)

Figure 9-26 DHCPv6 Server Dynamic Binding Table window

The fields that can be configured are described below:

Parameter	Description
<b>Pool Name</b>	Enter the name of the DHCPv6 pool for which to view dynamic binding information.

Click the **Clear** button to clear all the information entered in the fields.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Clear All** button to remove all the entries listed in the table.

Click the **View All** button to display all the existing entries.

## DHCPv6 Server Interface Settings

This window is used to display and configure the DHCPv6 Server state per interface

To view this window, click **Network Application > DHCP > DHCPv6 Server > DHCPv6 Server Interface Settings** as shown below:

DHCPv6 Server Interface Settings				
Interface Name	(Max: 12 characters)	Find		View All
<b>Total Entries: 1</b>				
Interface Name	DHCPv6 Server State	Edit		
System	Enabled			

Figure 9-27 DHCPv6 Server Interface Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Enter the name of the IP interface.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Edit** button to re-configure the specific entry.

## DHCPv6 Relay

### DHCPv6 Relay Global Settings

This window is used to configure the DHCPv6 relay function on the Switch.

To view this window, click **Network Application > DHCP > DHCPv6 Relay > DHCPv6 Relay Global Settings** as shown below:

Figure 9-28 DHCPv6 Relay Global Settings window

The fields that can be configured are described below:

Parameter	Description
<b>DHCPv6 Relay State</b>	Click the radio buttons to enable or disable the DHCPv6 relay function.
<b>DHCPv6 Relay Hops Count (1-32)</b>	Enter the number of relay agents that have to be relayed in this message. The default value is 4.

Click the **Apply** button to accept the changes made for each individual section.

## DHCPv6 Relay Settings

This window is used to configure the DHCPv6 relay state of one or all of the specified interfaces, and add or display a destination IPv6 address to or from the switch's DHCPv6 relay table.

To view this window, click **Network Application > DHCP > DHCPv6 Relay > DHCPv6 Relay Settings** as shown below:

Figure 9-29 DHCPv6 Relay Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Enter the name of the IPv6 interface. Tick the <b>All</b> check box to select all IPv6 interfaces.

<b>DHCPv6 Relay State</b>	Use the drop-down menu to enable or disable the DHCPv6 relay state of the interface.
<b>DHCPv6 Server Address</b>	Enter the DHCPv6 server IPv6 address.

Click the **Apply** button to accept the changes made.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

## DHCP Local Relay Settings

The DHCP local relay settings allows the user to add option 82 into DHCP request packets when the DHCP client gets an IP address from the same VLAN. If the DHCP local relay settings are not configured, the Switch will flood the packets to the VLAN. In order to add option 82 into the DHCP request packets, the DHCP local relay settings and the state of the Global VLAN need to be enabled.

To view this window, click **Network Application > DHCP > DHCP Local Relay Settings** as shown below:

Figure 9-30 DHCP Local Relay Settings window

The fields that can be configured are described below:

Parameter	Description
<b>DHCP Local Relay Global State</b>	Enable or disable the DHCP Local Relay Global State. The default is Disabled.
<b>VLAN Name</b>	This is the VLAN Name that identifies the VLAN the user wishes to apply the DHCP Local Relay operation.
<b>State</b>	Enable or disable the configuration of the DHCP Local Relay for VLAN state.

Click the **Apply** button to accept the changes made for each individual section.

## DNS

Computer users usually prefer to use text names for computers for which they may want to open a connection. Computers themselves, require 32 bit IP addresses. Somewhere, a database of network devices' text names and their corresponding IP addresses must be maintained.

The Domain Name System (DNS) is used to map names to IP addresses throughout the Internet and has been adapted for use within intranets. For two DNS servers to communicate across different subnets, the DNS Relay of the Switch must be used. The DNS servers are identified by IP addresses.

### Mapping Domain Names to Addresses

Name-to-address translation is performed by a program called a Name server. The client program is called a Name resolver. A Name resolver may need to contact several Name servers to translate a name to an address.

The Domain Name System (DNS) servers are organized in a somewhat hierarchical fashion. A single server often holds names for a single network, which is connected to a root DNS server - usually maintained by an ISP.

### **Domain Name Resolution**

The domain name system can be used by contacting the name servers one at a time, or by asking the domain name system to do the complete name translation. The client makes a query containing the name, the type of answer required, and a code specifying whether the domain name system should do the entire name translation, or simply return the address of the next DNS server if the server receiving the query cannot resolve the name.

When a DNS server receives a query, it checks to see if the name is in its sub domain. If it is, the server translates the name and appends the answer to the query, and sends it back to the client. If the DNS server cannot translate the name, it determines what type of name resolution the client requested. A complete translation is called recursive resolution and requires the server to contact other DNS servers until the name is resolved. Iterative resolution specifies that if the DNS server cannot supply an answer, it returns the address of the next DNS server the client should contact.

Each client must be able to contact at least one DNS server, and each DNS server must be able to contact at least one root server.

The address of the machine that supplies domain name service is often supplied by a DHCP or BOOTP server, or can be entered manually and configured into the operating system at startup.

## DNS Relay

### DNS Relay Global Settings

This window is used to configure the DNS Relay global parameters.

To view this window, click **Network Application > DNS > DNS Relay > DNS Relay Global Settings** as shown below:

Figure 9-31 DNS Relay Global Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>DNS Relay State</b>	Use the drop-down menu to enable or disable the DNS relay state.

<b>Primary Name Server</b>	Enter the primary DNS server IP address.
<b>Secondary Name Server</b>	Enter the secondary DNS server IP address.
<b>DNS Relay Cache State</b>	Use the drop-down menu to enable or disable the DNS relay cache state.
<b>DNS Relay Static Table State</b>	Use the drop-down menu to enable or disable the DNS relay static table state.

Click the **Apply** button to accept the changes made.

## DNS Relay Static Settings

This window is used to add or delete static entries into the switch's DNS resolution table.

To view this window, click **Network Application > DNS > DNS Relay > DNS Relay Static Settings** as shown below:

The screenshot shows the 'DNS Relay Static Settings' window. At the top, there is a header bar with a 'Safeguard' button. Below it, a section for adding a new entry is visible, with fields for 'Domain Name' and 'IP Address'. A table below lists one existing entry: 'DNSR' with IP '172.18.211.10'. There is a 'Delete' button next to the entry.

Total Entries: 1	
Domain Name	IP Address
DNSR	172.18.211.10

Figure 9-32 DNS Relay Static Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>Domain Name</b>	Enter the domain name.
<b>IP Address</b>	Enter the DNS Relay IP Address.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry.

## DNS Resolver

### DNS Resolver Global Settings

This window is used to configure the DNS Resolver global state of the switch.

To view this window, click **Network Application > DNS Resolver > DNS Resolver Global Settings** as shown below:

The screenshot shows the 'DNS Resolver Global Settings' window. It has two main configuration sections: 'DNS Resolver State' (radio buttons for 'Enabled' and 'Disabled') and 'Name Server Timeout (1-60)' (a numeric input field set to '3'). An 'Apply' button is located at the bottom right.

DNS Resolver State	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
Name Server Timeout (1-60)	3 sec

Figure 9-33 DNS Resolver Global Settings window

The fields that can be configured are described below:

Parameter	Description
<b>DNS Resolver State</b>	Click the radio buttons to enable or disable the DNS resolver state.
<b>Name Server Timeout (1-60)</b>	The maximum time waiting for a response from a specified name server.

Click the **Apply** button to accept the changes made.

## DNS Resolver Static Name Server Settings

The window is used to create the DNS Resolver name server of the switch. When adding a name server, if one primary name server exists in the static name server table and a new primary name server is added, the existing primary name server will be changed to a normal name server. If the added primary name server's IP address is the same as an existing normal name server's IP address, the existing normal name server will be changed to a primary name server, but won't add new name server. When no primary name server is specified, the first configured name server will automatically change to become the primary name server. If the deleted name server's IP address is the same as one of the existing name servers' IP addresses, regardless of whether a normal name server or primary name server, the name server will be deleted.

To view this window, click **Network Application > DNS Resolver > DNS Resolver Static Name Server Settings** as shown below:

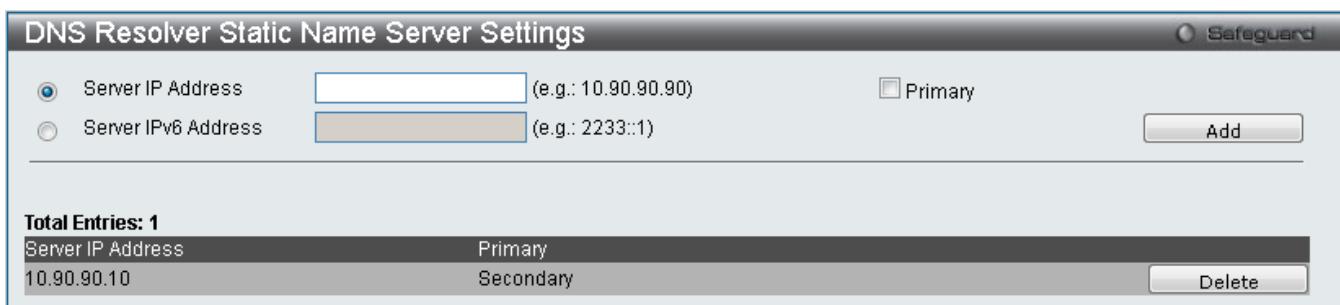

Figure 9-34 DNS Resolver Static Name Server Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Server IP Address</b>	Enter a DNS Resolver name server's IPv4 address here. Tick the <b>Primary</b> check box to set the name server as a primary name server.
<b>Server IPv6 Address</b>	Enter a DNS Resolver name server's IPv6 address here. Tick the <b>Primary</b> check box to set the name server as a primary name server.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry.

## DNS Resolver Dynamic Name Server Table

This window displays the current DNS Resolver name servers.

To view this window, click **Network Application > DNS Resolver > DNS Resolver Dynamic Name Server Table** as shown below:

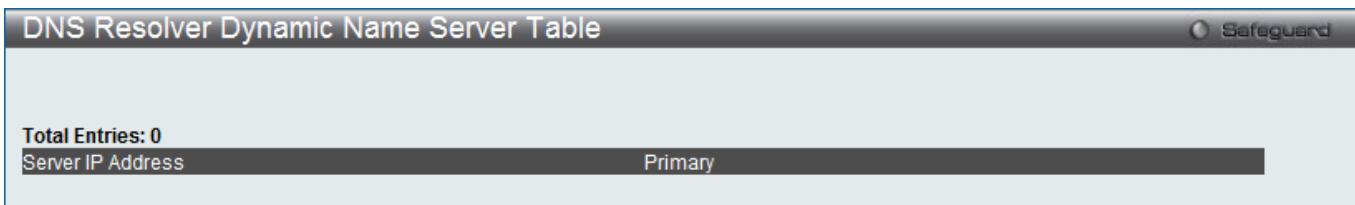

Figure 9-35 DNS Resolver Dynamic Name Server Table window

## DNS Resolver Static Host Name Settings

The window is used to create the static host name entry of the switch.

To view this window, click **Network Application > DNS Resolver > DNS Resolver Static Host Name Settings** as shown below:

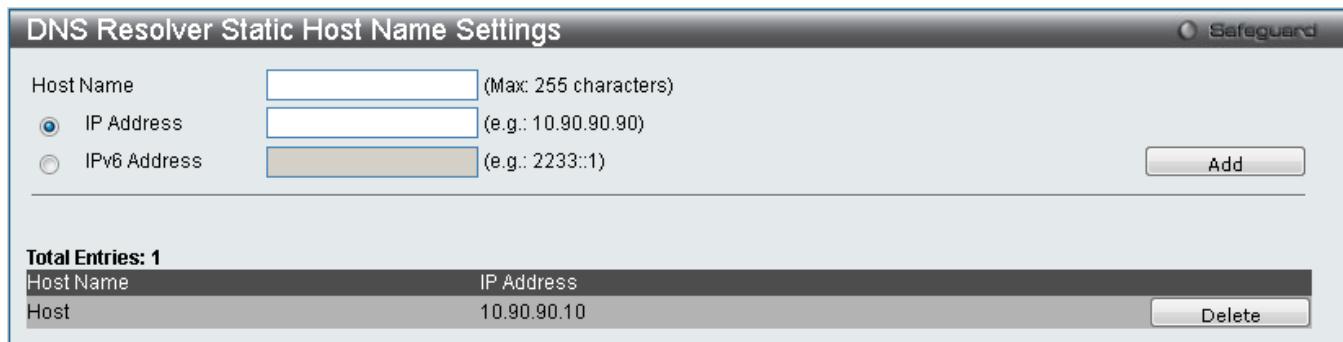

Figure 9-36 DNS Resolver Static Host Name Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Host Name</b>	Enter the name of the host.
<b>IP Address</b>	Enter the IPv4 address of the host here.
<b>IPv6 Address</b>	Enter the IPv6 address of the host here.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry.

## DNS Resolver Dynamic Host Name Table

This window displays the current host name entries.

To view this window, click **Network Application > DNS Resolver > DNS Resolver Dynamic Host Name Table** as shown below:

Figure 9-37 DNS Resolver Dynamic Host Name Table window

## RCP Server Settings

This window is used to configure global RCP server information. This global RCP Server setting can be used when the Server or remote user name is not specified. Only **ONE** RCP server can be configured per system. If user does not specify the RCP Server in the CLI command, and global RCP Server was not configured, the Switch will ask user to input the Server IP address or remote user name while executing the RCP commands.

To view this window, click **Network Application > RCP Server Settings** as shown below:

RCP Server Settings	
IP Address	<input type="text"/>
User Name	<input type="text"/>

RCP Server			
Address	Username		
192.168.69.1	Username		
		Edit	Delete

Figure 9-38 RCP Server Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>IP Address</b>	The IP address of global RCP Server. By default, the server is unspecified.
<b>User Name</b>	The remote user name for logon into global RCP Server. By default, global server's remote user name is unspecified.

Click the **Apply** button to accept the changes made.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## SMTP Settings

SMTP or Simple Mail Transfer Protocol is a function of the Switch that will send switch events to mail recipients based on e-mail addresses entered in the window below. The Switch is to be configured as a client of SMTP while the server is a remote device that will receive messages from the Switch, place the appropriate information into an e-mail and deliver it to recipients configured on the Switch. This can benefit the Switch administrator by simplifying the management of small workgroups or wiring closets, increasing the speed of handling emergency Switch events, and enhancing security by recording questionable events occurring on the Switch.

Users can set up the SMTP server for the Switch, along with setting e-mail addresses to which switch log files can be sent when a problem arises on the Switch.

The Switch will send out e-mail to recipients when one or more of the following events occur:

- When a cold start occurs on the Switch.
- When a port enters a link down status.
- When a port enters a link up status.
- When SNMP authentication has been denied by the Switch.
- When a switch configuration entry has been saved to the NVRAM by the Switch.

- When an abnormality occurs on TFTP during a firmware download event. This includes in-process, invalid-file, violation, file-not-found, complete and time-out messages from the TFTP server.
- When a system reset occurs on the Switch.

Information within the e-mail from the SMTP server regarding switch events includes:

- The source device name and IP address.
- A timestamp denoting the identity of the SMTP server and the client that sent the message, as well as the time and date of the message received from the Switch. Messages that have been relayed will have timestamps for each relay.
- The event that occurred on the Switch, prompting the e-mail message to be sent.
- When an event is processed by a user, such as save or firmware upgrade, the IP address, MAC address and User Name of the user completing the task will be sent along with the system message of the event occurred.
- When the same event occurs more than once, the second mail message and every repeating mail message following will have the system's error message placed in the subject line of the mail message.

The following details events occurring during the Delivery Process.

- Urgent mail will have high priority and be immediately dispatched to recipients while normal mail will be placed in a queue for future transmission.
- The maximum number of un-transmitted mail messages placed in the queue cannot exceed 30 messages. Any new messages will be discarded if the queue is full.
- If the initial message sent to a mail recipient is not delivered, it will be placed in the waiting queue until its place in the queue has been reached, and then another attempt to transmit the message is made. The maximum attempts for delivering mail to recipients is three. Mail message delivery attempts will be tried every five minutes until the maximum number of attempts is reached. Once reached and the message has not been successfully delivered, the message will be dropped and not received by the mail recipient.
- If the Switch shuts down or reboots, mail messages in the waiting queue will be lost.

To view this window, click **Network Application > SMTP Settings** as shown below:

The screenshot shows the 'SMTP Settings' window with the following sections:

- SMTP Global Settings:** Includes fields for 'SMTP State' (radio buttons for Enabled or Disabled), 'SMTP Server Address' (0.0.0.0), 'SMTP Server Port (1-65535)' (25), 'Self Mail Address' (empty), and an 'Apply' button.
- SMTP Mail Receiver Address:** Includes a 'Add A Mail Receiver' input field and an 'Add' button.
- Send a Test Mail to All:** Includes 'Subject' and 'Content' input fields and an 'Apply' button.
- Recipient Table:** A table listing 8 entries with columns 'Index' and 'Mail Receiver Address'. Each entry has a 'Delete' button to its right.

Figure 9-39 SMTP Settings window

The fields that can be configured are described below:

Parameter	Description
<b>SMTP State</b>	Use the radio button to enable or disable the SMTP service on this device.
<b>SMTP Server Address</b>	Enter the IP address of the SMTP server on a remote device. This will be the device that sends out the mail for you.
<b>SMTP Server Port</b>	Enter the virtual port number that the Switch will connect with on the SMTP server. The common port number for SMTP is 25, yet a value between 1 and 65535 can be chosen.
<b>Self Mail Address</b>	Enter the e-mail address from which mail messages will be sent. This address will be the "from" address on the e-mail message sent to a recipient. Only one self-mail address can be configured for this Switch. This string can be no more than 64 alphanumeric characters.
<b>Add a Mail Receiver</b>	Enter an e-mail address and click the Add button. Up to eight e-mail addresses can be added per Switch. To delete these addresses from the Switch, click the corresponding Delete button in the SMTP Mail Receiver Address table at the bottom of the window.
<b>Send a Test Mail to All</b>	Here the user can send a test mail to all the addresses listed.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry.

# SNTP

The Simple Network Time Protocol (SNTP) is a protocol for synchronizing computer clocks through the Internet. It provides comprehensive mechanisms to access national time and frequency dissemination services, organize the SNTP subnet of servers and clients, and adjust the system clock in each participant.

## SNTP Settings

Users can configure the time settings for the Switch.

To view this window, click **Network Application > SNTP > SNTP Settings** as shown below:

The screenshot shows the 'SNTP Settings' window. At the top left is the title 'SNTP Settings'. On the right side, there is a 'Safeguard' icon. Below the title, under 'Status', there is a section for 'SNTP State' with two radio buttons: 'Enabled' (unchecked) and 'Disabled' (checked). To the right of the radio buttons are the current date and time '31/10/2012 15:18:49' and the 'Time Source' 'System Clock'. Under 'SNTP Settings', there are fields for 'IPv4 SNTP Primary Server' (0.0.0.0), 'IPv4 SNTP Secondary Server' (0.0.0.0), 'IPv6 SNTP Primary Server' (::), 'IPv6 SNTP Secondary Server' (::), and 'SNTP Poll Interval In Seconds (30-99999)' (720). At the bottom right of the window is an 'Apply' button.

**Figure 9-40 SNTP Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>SNTP State</b>	Use this radio button to enable or disable SNTP.
<b>IPv4 SNTP Primary Server</b>	The IPv4 address of the primary server from which the SNTP information will be taken.
<b>IPv4 SNTP Secondary Server</b>	The IPv4 address of the secondary server from which the SNTP information will be taken.
<b>IPv6 SNTP Primary Server</b>	The IPv6 address of the primary server from which the SNTP information will be taken.
<b>IPv6 SNTP Secondary Server</b>	The IPv6 address of the secondary server from which the SNTP information will be taken.
<b>SNTP Poll Interval In Seconds (30-99999)</b>	The interval, in seconds, between requests for updated SNTP information.

Click the **Apply** button to accept the changes made.

## Time Zone Settings

Users can configure time zones and Daylight Savings Time settings for SNTP.

To view this window, click **Network Application > SNTP > Time Zone Settings** as shown below:

The screenshot shows the 'Time Zone Settings' window with the following configuration:

- Daylight Saving Time State:** Disabled
- Daylight Saving Time Offset in Minutes:** 60
- Time Zone Offset: From GMT in +/-HH:MM:** + 00 00
- DST Repeating Settings:**
  - From: Which Week of the Month: First
  - From: Day of the Week: Sun
  - From: Month: Apr
  - From: Time in HH MM: 00 00
  - To: Which Week of the Month: Last
  - To: Day of the Week: Sun
  - To: Month: Oct
  - To: Time in HH MM: 00 00
- DST Annual Settings:**
  - From: Month: Apr
  - From: Day: 29
  - From: Time in HH MM: 00 00
  - To: Month: Oct
  - To: Day: 12
  - To: Time in HH MM: 00 00

Figure 9-41 Time Zone Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Daylight Saving Time State</b>	Use this drop-down menu to enable or disable the DST Settings.
<b>Daylight Saving Time Offset In Minutes</b>	Use this drop-down menu to specify the amount of time that will constitute your local DST offset – 30, 60, 90, or 120 minutes.
<b>Time Zone Offset From GMT In +/- HH:MM</b>	Use these drop-down menus to specify your local time zone's offset from Greenwich Mean Time (GMT.)

Parameter	Description
<b>DST Repeating Settings</b>	Using repeating mode will enable DST seasonal time adjustment. Repeating mode requires that the DST beginning and ending date be specified using a formula. For example, specify to begin DST on Saturday during the second week of April and end DST on Sunday during the last week of October.
<b>From: Which Week Of The Month</b>	Enter the week of the month that DST will start.
<b>From: Day Of Week</b>	Enter the day of the week that DST will start on.

<b>From: Month</b>	Enter the month DST will start on.
<b>From: Time In HH:MM</b>	Enter the time of day that DST will start on.
<b>To: Which Week Of The Month</b>	Enter the week of the month the DST will end.
<b>To: Day Of Week</b>	Enter the day of the week that DST will end.
<b>To: Month</b>	Enter the month that DST will end.
<b>To: Time In HH:MM</b>	Enter the time DST will end.

Parameter	Description
<b>DST Annual Settings</b>	Using annual mode will enable DST seasonal time adjustment. Annual mode requires that the DST beginning and ending date be specified concisely. For example, specify to begin DST on April 3 and end DST on October 14.
<b>From: Month</b>	Enter the month DST will start on, each year.
<b>From: Day</b>	Enter the day of the month DST will start on, each year.
<b>From: Time In HH:MM</b>	Enter the time of day DST will start on, each year.
<b>To: Month</b>	Enter the month DST will end on, each year.
<b>To: Day</b>	Enter the day of the month DST will end on, each year.
<b>To: Time In HH:MM</b>	Enter the time of day that DST will end on, each year.

Click the **Apply** button to accept the changes made.

## UDP

### UDP Helper

The UDP Helper forwards specific broadcasts to a server according to the UDP destination ports. It will decrease the network traffic compared to a broadcast packet propagated to all the subnets.

### UDP Helper Settings

On this page, the user can configure the UDP Helper settings.

To view this window, click **Network Application > UDP > UDP Helper > UDP Helper Settings** as shown below:

The screenshot shows the 'UDP Helper Settings' window. At the top, there is a radio button for 'Enabled' which is selected, and another for 'Disabled'. Below this are fields for 'UDP Port' (set to 'Time') and 'UDP Port (0-65535)' with a text input field containing '80'. There are 'Apply' and 'Add' buttons. A table below lists 'Total Entries: 7' with columns for 'Application' and 'UDP Port'. Each entry has a 'Delete' button to its right. The entries are:

Application	UDP Port	Delete
Time Service	37	Delete
TACACS	49	Delete
DNS	53	Delete
TFTP	69	Delete
NetBIOS NS	137	Delete
NetBIOS DS	138	Delete
User Application 1	80	Delete

Figure 9-42 UDP Helper Settings window

The fields that can be configured are described below:

Parameter	Description
<b>UDP Helper State</b>	Specifies to enable or disable the UDP Helper function on the Switch.
<b>UDP Port</b>	This option is used to add a UDP port for the UDP Helper function on the Switch. <i>Time</i> - Specifies the Time service. The UDP port number is 37. <i>TACACS</i> - Specifies the Terminal Access Controller Access Control System service. The UDP port number is 49. <i>DNS</i> - Specifies the Domain Naming System service. The UDP port number is 53. <i>TFTP</i> - Specifies the Trivial File Transfer Protocol service. The UDP port number is 69. <i>NetBIOS NS</i> - Specifies the NetBIOS Name Server service. The UDP port number is 137. <i>NetBIOS DS</i> - Specifies the NetBIOS Datagram Server service. The UDP port number is 138. <i>UDP Port</i> - Enter any UDP ports used for services not listed. This value must be between 0 and 65535.

Click the **Apply** button to accept the changes made.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove the specific entry.

## UDP Helper Server Settings

On this page, the user can configure the UDP Helper Server settings.

To view this window, click **Network Application > UDP > UDP Helper > UDP Helper Server Settings** as shown below:

The screenshot shows the 'UDP Helper Server Settings' window. At the top, there are input fields for 'Interface Name' and 'Server IP Address', both with placeholder text '(Max: 12 characters)' and '(e.g.: 10.90.90.6)'. Below these are 'Add', 'Find', and 'View All' buttons. A message 'Total Entries: 1' is displayed above a table row. The table has two columns: 'Interface Name' (containing 'System') and 'Server IP Address' (containing '10.90.90.6'). A 'View Detail' link is located next to the IP address.

Figure 9-43 UDP Helper Server Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Enter the IP interface name used here. This name can be up to 12 characters long.
<b>Server IP Address</b>	Enter the UDP Helper Server IP address here.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the [View Detail](#) link to view more information regarding the specific entry.

After clicking in the [View Detail](#) link, the following window will appear:

The screenshot shows the 'UDP Helper Server Settings' window in 'View Detail' mode. It includes a 'Back' button, a 'Total Entries: 1' message, and a table with columns for 'Interface Name' (System) and 'Server IP Address' (10.90.90.6). A 'Delete' button is located on the right side of the table row.

Figure 9-44 UDP Helper Server Settings window (View Detail)

Click the **Delete** button to remove the specific entry.

Click the **<<Back** button to return to the previous page.

## Flash File System Settings

### Why use flash file system:

In old switch system, the firmware, configuration and log information are saved in a flash with fixed addresses and size. This means that the maximum configuration file can only be 2Mb, and even if the current configuration is only 40Kb, it will still take up 2Mb of flash storage space. The configuration file number and firmware numbers are also fixed. A compatible issue will occur in the event that the configuration file or firmware size exceeds the originally designed size.

### Flash File System in our system:

The Flash File System is used to provide the user with flexible file operation on the Flash. All the firmware, configuration information and system log information are stored in the Flash as files. This means that the Flash space taken up by all the files are not fixed, it is the real file size. If the Flash space is enough, the user could download more configuration files or firmware files and use commands to display Flash file information, rename file names, and delete it. Furthermore, the user can also configure the **boot up runtime image** or the **running configuration file** if needed.

In case the file system gets corrupted, Z-modem can be used to download the backup files directly to the system.

To view this window, click **Network Application > Flash File System Settings** as shown below:

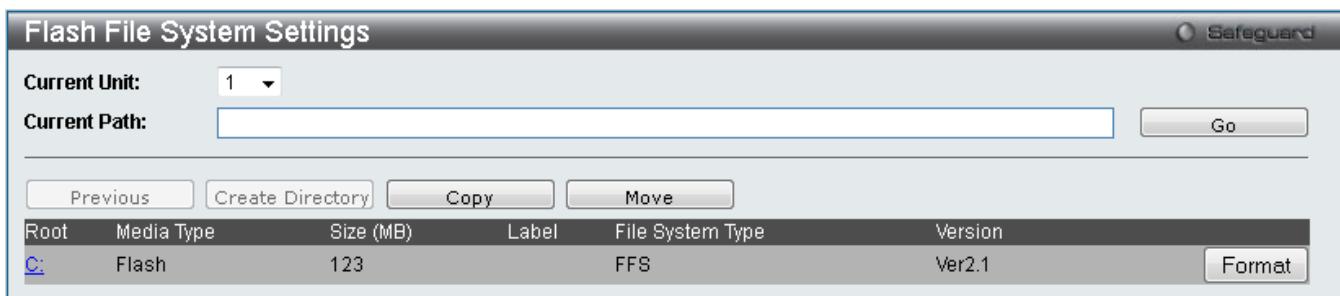

Figure 9-45 Flash File System Settings window

Select the **Current Unit** ID and enter the **Current Path** string and click the **Go** button to navigate to the path entered. Click the **Format** button to format the root. Click the [C:](#) link to navigate the C: drive.

After clicking the [C:](#) link button, the following page will appear:

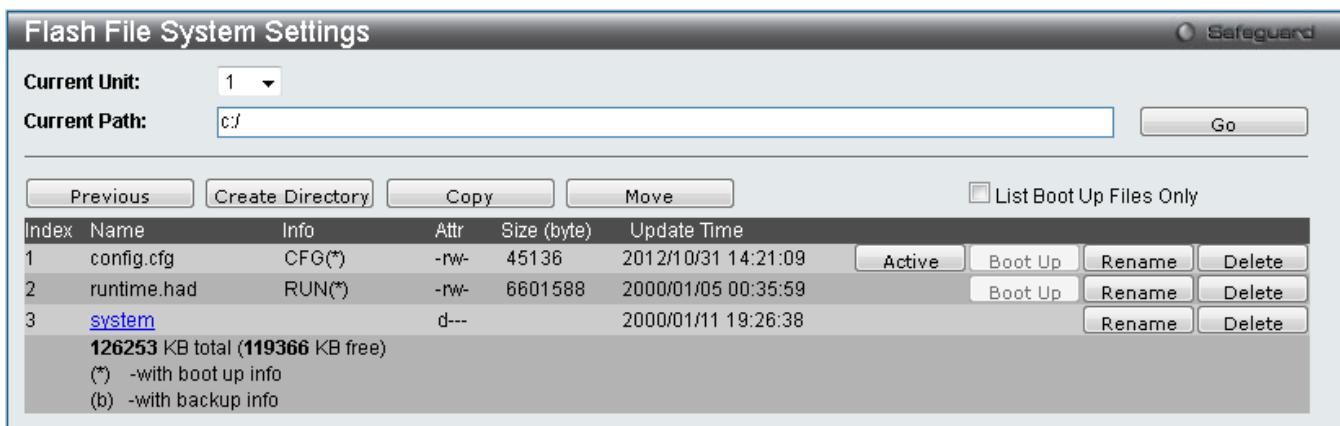

Figure 9-46 Flash File System Setting – Search for Drive window

Click the **Previous** button to return to the previous page.

Click the **Create Directory** to create a new directory within the file system of the switch.

Click the **Copy** button to copy a specific file to the switch.

Click the **Move** button to move a specific file within the switch.

Tick the **List Boot Up Files Only** option to display only the boot up files.

Click the **Active** button to set a specific config file as the active runtime configuration.

Click the **Boot Up** button to set a specific runtime image or configuration as the boot up.

Click the **Rename** button to rename a specific file's name.

Click the **Delete** button to remove a specific file from the file system.

Click the **Copy** button to see the following window.

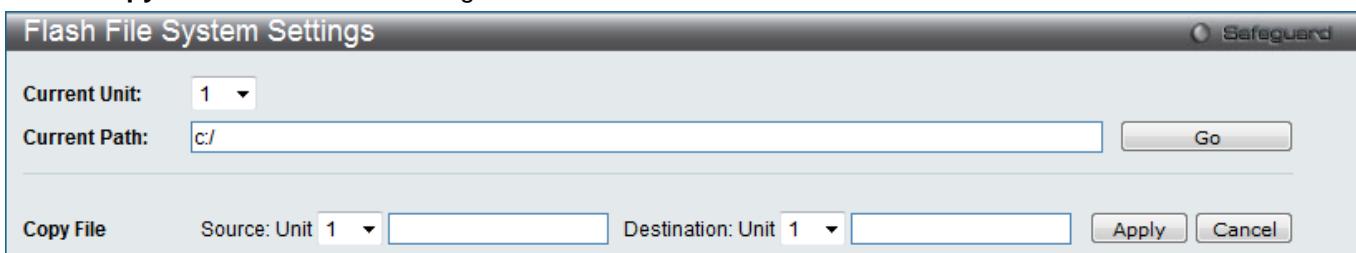

Figure 9-47 Flash File System Settings – Copy window

When copying a file to the file system of this switch, the user must enter the **Source** and **Destination** path.  
Click the **Apply** button to initiate the copy.  
Click the **Cancel** button to discard the process.

Click the **Move** button to see the following window

The screenshot shows the 'Flash File System Settings' window with the 'Move' tab selected. At the top, there's a dropdown for 'Current Unit' set to '1'. Below it is a 'Current Path' input field with a 'Go' button. In the center, there's a 'Move File' section with two dropdowns: 'Source: Unit 1' and 'Destination: Unit 1'. To the right of these dropdowns are 'Apply' and 'Cancel' buttons. The entire window has a dark header bar with the title and some icons.

Figure 9-48 Flash File System Settings – Move window

When moving a file to another place, the user must enter the **Source** and **Destination** path.  
Click the **Apply** button to initiate the copy.  
Click the **Cancel** button to discard the process.

# Chapter 10 OAM

**CFM**

**Ethernet OAM**

**DULD Settings**

**Cable Diagnostics**

## CFM

### CFM Settings

On this page the user can configure the CFM parameters.

To view this window, click **OAM > CFM > CFM Settings**, as shown below:

The screenshot shows the 'CFM Settings' window with the following sections:

- CFM Global Settings:** Contains radio buttons for enabling/disabling CFM State, AIS Trap State, LCK Trap State, and All MPs Reply LTRs. Each row has an 'Apply' button.
- CFM MD Settings:** Contains fields for MD (text input), MD Index (text input), Level (dropdown menu set to 0), MIP (dropdown menu set to None), and SenderID TLV (dropdown menu set to None). An 'Apply' button is present.
- Note:** A note states "Note: MD should be less than 22 characters."
- Total Entries: 1:** A table with one entry:
 

Level	MD Index	MD Name	MIP Creation	SenderID TLV
0	1	MD	None	None

 Buttons for Edit, Delete, and Add MA are available.

Figure 10-1 CFM Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>CFM State</b>	Click the radio buttons to enable or disable the CFM feature.
<b>AIS Trap State</b>	Click to enable or disable the AIS trap state.
<b>LCK Trap State</b>	Click to enable or disable the LCK trap state.
<b>All MPs Reply LTRs</b>	Click the radio buttons to enable or disable all MPs to reply LTRs.
<b>MD</b>	Enter the maintenance domain name.
<b>MD Index</b>	Enter the maintenance domain index used.
<b>Level</b>	Use the drop-down menu to select the maintenance domain level.
<b>MIP</b>	This is the control creation of MIPs.

	<p><i>None</i> – Don't create MIPs. This is the default value.</p> <p><i>Auto</i> – MIPs can always be created on any ports in this MD, if that port is not configured with an MEP of this MD. For the intermediate switch in an MA, the setting must be auto in order for the MIPs to be created on this device.</p> <p><i>Explicit</i> – MIPs can be created on any ports in this MD, only if the next existent lower level has an MEP configured on that port, and that port is not configured with an MEP of this MD.</p>
<b>SenderId TLV</b>	<p>This is the control transmission of the SenderID TLV.</p> <p><i>None</i> – Don't transmit sender ID TLV. This is the default value.</p> <p><i>Chassis</i> – Transmit sender ID TLV with chassis ID information.</p> <p><i>Manage</i> – Transmit sender ID TLV with managed address information.</p> <p><i>Chassis Manage</i> – Transmit sender ID TLV with chassis ID information and manage address information.</p>

Click the **Apply** button to accept the changes made for each individual section.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

**NOTE:** The MD Name value should not be more than 22 characters.

To add a maintenance association (MA), click the **Add MA** button.

Click the **Add MA** button to see the following window

**CFM MA Settings**

MD	MD	
MD Index	1	
MA (Max: 22 characters)	<input type="text"/>	
MA Index	<input type="text"/>	
VID (1-4094)	<input type="text"/>	
<input type="button" value="Add"/> <input type="button" value="&lt;&lt;Back"/>		

Total Entries: 1

MA Index	MA	VID	MIP	SenderId	CCM	MEP ID(s)	
1	MA	1	Defer	Defer	10 seconds	1	<input type="button" value="MIP Port Table"/> <input type="button" value="Edit"/> <input type="button" value="Delete"/> <input type="button" value="Add MEP"/>

Figure 10-2 CFM MA Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>MA</b>	Enter the maintenance association name.
<b>MA Index</b>	Enter the maintenance association index.
<b>VID</b>	VLAN Identifier. Different MA must be associated with different VLANs.

Click the **Add** button to add a new entry based on the information entered.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

Click the **MIP Port Table** button to view the CFM MIP Table.

Click the **Add MEP** button to add a Maintenance End Point entry.

After clicking the **Edit** button, the following window appears:

MA Index	MA	VID	MIP	SenderId	CCM	MEP ID(s)
1	MA	1	Defer	Defer	10sec	1

Figure 10-3 CFM MA Settings (Edit) Window

The fields that can be configured are described below:

Parameter	Description
<b>MIP</b>	This is the control creation of MIPs. <i>None</i> - Don't create MIPs. <i>Auto</i> - MIPs can always be created on any ports in this MA, if that port is not configured with an MEP of that MA. <i>Explicit</i> - MIP can be created on any ports in this MA, only if the next existent lower level has an MEP configured on that port, and that port is not configured with an MEP of this MA. <i>Defer</i> - Inherit the setting configured for the maintenance domain that this MA is associated with. This is the default value.
<b>SenderId</b>	This is the control transmission of the sender ID TLV. <i>None</i> - Don't transmit sender ID TLV. This is the default value. <i>Chassis</i> - Transmit sender ID TLV with chassis ID information. <i>Manage</i> - Transmit sender ID TLV with manage address information. <i>Chassis Manage</i> - Transmit sender ID TLV with chassis ID information and manage address information. <i>Defer</i> - Inherit the setting configured for the maintenance domain that this MA is associated with. This is the default value.
<b>CCM</b>	This is the CCM interval. <i>100ms</i> - 100 milliseconds. Not recommended. For test purpose. <i>1sec</i> - One second. <i>10sec</i> - Ten seconds. This is the default value. <i>1min</i> - One minute. <i>10min</i> - Ten minutes.
<b>MEP ID(s)</b>	This is to specify the MEP IDs contained in the maintenance association. The range of the MEP ID is 1-8191.

	<p><b>Add</b> - Add MEP ID(s).</p> <p><b>Delete</b> - Delete MEP ID(s).</p> <p>By default, there is no MEP ID in a newly created maintenance association.</p>

-------	-------------	--------	-----	-------------	------------------	-----	-------------

Figure 10-7 CFM MEP Information (Edit) Window

The fields that can be configured are described below:

Parameter	Description
<b>MEP State</b>	This is the MEP administrative state. <i>Enable</i> - MEP is enabled. <i>Disable</i> - MEP is disabled. This is the default value.
<b>CCM State</b>	This is the CCM transmission state. <i>Enable</i> - CCM transmission enabled. <i>Disable</i> - CCM transmission disabled. This is the default value.
<b>PDU Priority</b>	The 802.1p priority is set in the CCMs and the LTMs messages transmitted by the MEP. The default value is 7.
<b>Fault Alarm</b>	This is the control types of the fault alarms sent by the MEP. <i>All</i> - All types of fault alarms will be sent. <i>MAC Status</i> - Only the fault alarms whose priority is equal to or higher than "Some Remote MEP MAC Status Error" are sent. <i>Remote CCM</i> - Only the fault alarms whose priority is equal to or higher than "Some Remote MEP Down" are sent. <i>Errors CCM</i> - Only the fault alarms whose priority is equal to or higher than "Error CCM Received" are sent. <i>Xcon CCM</i> - Only the fault alarms whose priority is equal to or higher than "Cross-connect CCM Received" are sent. <i>None</i> - No fault alarm is sent. This is the default value.
<b>Alarm Time</b>	This is the time that a defect must exceed before the fault alarm can be sent. The unit is in centiseconds, the range is 250-1000. The default value is 250.
<b>Alarm Reset Time</b>	This is the dormant duration time before a defect is triggered before the fault can be re-alarmed. The unit is in centiseconds, the range is 250-1000. The default value is 1000.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

Click the **Edit AIS** button to configure the AIS settings.

Click the **Edit LCK** button to configure the LCK settings.

After clicking the **Edit AIS** button, the following window will appear:

CFM Extension AIS Settings	
MD Name	MD
MD Index	1
MA Name	MA
MA Index	1
MEP ID	1
State	Disabled
Period	1sec
Level	
<input type="button" value="Apply"/> <input type="button" value="&lt;&lt;Back"/>	

**Figure 10-8 CFM Extension AIS (Edit) Window**

The fields that can be configured are described below:

Parameter	Description
<b>State</b>	Tick the check box and use the drop-down menu to enable or disable the AIS function.
<b>Period</b>	Tick the check box and use the drop-down menu to select the transmitting interval of AIS PDU.
<b>Level</b>	Tick the check box and use the drop-down menu to select the client level ID to which the MEP sends AIS PDU. The default client MD level is MD level at which the most immediate client layer MIPs and MEPs exist. Options to choose from are values between 0 and 7.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

After click the **Edit LCK** button, the following window will appear:

CFM Extension LCK Settings

State	Disabled
Period	1sec
Level	
<input type="button" value="Apply"/> <input type="button" value="&lt;&lt;Back"/>	

**Figure 10-9 CFM Extension LCK Settings (Edit) Window**

The fields that can be configured are described below:

Parameter	Description
-----------	-------------

<b>State</b>	Tick the check box and use the drop-down menu to enable or disable the LCK function.
<b>Period</b>	Tick the check box and use the drop-down menu to select the transmitting interval of LCK PDU.
<b>Level</b>	Tick the check box and use the drop-down menu to select the client level ID to which the MEP sends LCK PDU. The default client MD level is MD level at which the most immediate client layer MIPs and MEPs exist. Options to choose from are values between 0 and 7.

Click the **Apply** button to accept the changes made.

Click the <<Back button to discard the changes made and return to the previous page.

## CFM Port Settings

This window is used to configure the CFM port state.

To view this window, click **OAM > CFM > CFM Port Settings**, as shown below:

The screenshot shows the 'CFM Port Settings' window. At the top, there is a header bar with a 'Safeguard' icon. Below the header, there is a configuration section with four dropdown menus: 'Unit' (set to 1), 'From Port' (set to 01), 'To Port' (set to 01), and 'State' (set to 'Disabled'). To the right of this section is an 'Apply' button. Below this is a table titled 'CFM Port Settings' with 12 rows, each representing a port from 1 to 12. The 'Port' column lists the port numbers, and the 'State' column shows that all ports are currently set to 'Disabled'.

Port	State
1	Disabled
2	Disabled
3	Disabled
4	Disabled
5	Disabled
6	Disabled
7	Disabled
8	Disabled
9	Disabled
10	Disabled
11	Disabled
12	Disabled

Figure 10-10 CFM Port Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menu to select a range of ports used for this configuration.
<b>State</b>	Use the drop-down menu to enable or disable the state of specific port regarding the CFM configuration.

Click the **Apply** button to accept the changes made.

## CFM MIPCCM Table

This window is used to display CFM MIPCCM information.

To view this window, click **OAM > CFM > CFM MIPCCM Table**, as shown below:

CFM MIPCCM Table			
Total Entries: 0			
MA	VID	MAC Address	Port

Figure 10-11 CFM MIPCCM Table Window

## CFM Loopback Settings

This window is used to CFM loopback settings.

To view this window, click **OAM > CFM > CFM Loopback Settings**, as shown below:

CFM Loopback Settings	
<input checked="" type="radio"/> MEP Name (Max: 32 characters)	<input type="text"/>
<input type="radio"/> MEP ID (1-8191)	<input type="text"/>
<input type="radio"/> MD Name (Max: 22 characters)	<input type="text"/>
<input type="radio"/> MD Index	<input type="text"/>
<input type="radio"/> MA Name (Max: 22 characters)	<input type="text"/>
<input type="radio"/> MA Index	<input type="text"/>
MAC Address	<input type="text"/>
LBMs Number (1-65535)	<input type="text" value="4"/>
<input checked="" type="radio"/> LBM Payload Length (0-1500)	<input type="text" value="0"/>
<input type="radio"/> LBM Payload Pattern (Max: 1500 characters)	<input type="text"/>
LBMs Priority	<input type="text" value="None"/>
<input type="button" value="Apply"/>	

Figure 10-12 CFM Loopback Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>MEP Name</b>	Select and enter the Maintenance End Point name used.
<b>MEP ID (1-8191)</b>	Select and enter the Maintenance End Point ID used.
<b>MD Name</b>	Select and enter the Maintenance Domain name used.
<b>MD Index</b>	Select and enter the Maintenance Domain index used.
<b>MA Name</b>	Select and enter the Maintenance Association name used.
<b>MA Index</b>	Select and enter the Maintenance Association index used.
<b>MAC Address</b>	Enter the destination MAC address used here.
<b>LBMs Number (1-65535)</b>	Number of LBMs to be sent. The default value is 4.
<b>LBM Payload Length (0-1500)</b>	The payload length of LBM to be sent. The default is 0.
<b>LBM Payload Pattern</b>	An arbitrary amount of data to be included in a Data TLV, along with an indication whether the Data TLV is to be included.

<b>LBMs Priority</b>	The 802.1p priority to be set in the transmitted LBMs. If not specified, it uses the same priority as CCMs and LTMs sent by the MA.
----------------------	---

Click the **Apply** button to accept the changes made.

## CFM Linktrace Settings

This window is used to configure the CFM linktrace settings.

To view this window, click **OAM > CFM > CFM Linktrace Settings**, as shown below:

The screenshot shows the 'CFM Linktrace Settings' window. At the top, there are input fields for MEP Name (radio button selected), MEP ID (1-8191), MD Name, MD Index, MAC Address, TTL (2-255) set to 64, PDU Priority set to None, and an 'Apply' button. Below this is a note about character limits and a MAC address range. The main area contains two rows of configuration fields: one row with checked boxes for MEP Name, MD Name, and MD Index, and another row with unchecked boxes for MA Name and MA Index, followed by a 'MEP ID (1-8191)' field. At the bottom are 'Find', 'Delete', and 'Delete All' buttons. A table at the bottom lists columns for Transaction ID, Source MEP, and Destination.

Transaction ID	Source MEP	Destination
----------------	------------	-------------

Figure 10-13 CFM Linktrace Settings Window

The fields that can be configured are described below:

Parameter	Description
<b>MEP Name</b>	Select and enter the Maintenance End Point name used.
<b>MEP ID (1-8191)</b>	Select and enter the Maintenance End Point ID used.
<b>MD Name</b>	Select and enter the Maintenance Domain name used.
<b>MD Index</b>	Select and enter the Maintenance Domain index used.
<b>MA Name</b>	Select and enter the Maintenance Association name used.
<b>MA Index</b>	Select and enter the Maintenance Association index used.
<b>MAC Address</b>	Here the user can enter the destination MAC address.
<b>TTL</b>	Link-trace message TTL value. The default value is 64.
<b>PDU Priority</b>	The 802.1p priority to be set in the transmitted LTM. If not specified, it uses the same priority as CCMs sent by the MA.

Click the **Apply** button to accept the changes made.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Delete** button to remove the specific entry based on the information entered.

Click the **Delete All** button to remove all the entries listed.

## CFM Packet Counter

This window is used to display the CFM packet counter information.

To view this window, click **OAM > CFM > CFM Packet Counter**, as shown below:

The screenshot shows the 'CFM Packet Counter' window. At the top, there is a search bar labeled 'Port List (e.g.: 1:1, 1:5-1:10)' with a dropdown menu set to 'All Ports' and a type dropdown set to 'Transmit'. Below the search bar is a table titled 'CFM Transmit Statistics' with columns: Port, All Packets, CCM, LBR, LBM, LTR, and LTM. The table lists ports from 1:1 to 1:10, all of which show 0 for all metrics.

Port	All Packets	CCM	LBR	LBM	LTR	LTM
All	0	0	0	0	0	0
1:1	0	0	0	0	0	0
1:2	0	0	0	0	0	0
1:3	0	0	0	0	0	0
1:4	0	0	0	0	0	0
1:5	0	0	0	0	0	0
1:6	0	0	0	0	0	0
1:7	0	0	0	0	0	0
1:8	0	0	0	0	0	0
1:9	0	0	0	0	0	0
1:10	0	0	0	0	0	0

Figure 10-14 CFM Packet Counter Window

The fields that can be configured are described below:

Parameter	Description
Port List	Enter a port or range of ports to display. Tick the <b>All Ports</b> check box to display all ports.
Type	<i>Transmit</i> – Selecting this option will display all the CFM packets transmitted. <i>Receive</i> – Selecting this option will display all the CFM packets received. <i>CCM</i> – Selecting this option will display all the CFM packets transmitted and received.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Clear** button to clear all the information entered in the fields.

## CFM Fault Table

This window is used to display the CFM fault information.

To view this window, click **OAM > CFM > CFM Fault Table**, as shown below:

The screenshot shows the 'CFM Fault Table' window. It features search fields for 'MD Name' and 'MA Name' with checkboxes, and 'MD Index' and 'MA Index' with checkboxes. A 'Find' button is located to the right of the search fields. Below the search area is a note: 'Note: MD should be less than 22 characters; MA should be less than 22 characters; MD/MA index range: 1-4294967295.' At the bottom of the window is a table header with columns: MD Name, MA Name, MEPID, Status, AIS Status, and LCK Status.

MD Name	MA Name	MEPID	Status	AIS Status	LCK Status
---------	---------	-------	--------	------------	------------

Figure 10-15 CFM Fault Table Window

The fields that can be configured are described below:

Parameter	Description
<b>MD Name</b>	Select and enter the Maintenance Domain name used.
<b>MD Index</b>	Select and enter the Maintenance Domain index used.
<b>MA Name</b>	Select and enter the Maintenance Association name used.
<b>MA Index</b>	Select and enter the Maintenance Association index used.

Click the **Find** button to locate a specific entry based on the information entered.

## CFM MP Table

This window is used to display the CFM MP information.

To view this window, click **OAM > CFM > CFM MP Table**, as shown below:

MAC Address: 00-01-02-03-05-00					
MD Name	MA Name	MEPID	Level	Direction	VID
MD	MA	1	0	Inward	1

Figure 10-16 CFM MP Table Window

The fields that can be configured are described below:

Parameter	Description
<b>Port</b>	Use the drop-down menu to select the unit ID and the port number to view.
<b>Level</b>	Enter the level to view.
<b>Direction</b>	Use the drop-down menu to select the direction to view. <i>Inward</i> - Inward facing (up) MP. <i>Outward</i> - Outward facing (down) MP.
<b>VID</b>	Enter the VLAN ID to view.

Click the **Find** button to locate a specific entry based on the information entered.

## Ethernet OAM

### Ethernet OAM Settings

This window is used to configure the Ethernet OAM settings.

To view this window, click **OAM > Ethernet OAM > Ethernet OAM Settings**, as shown below:

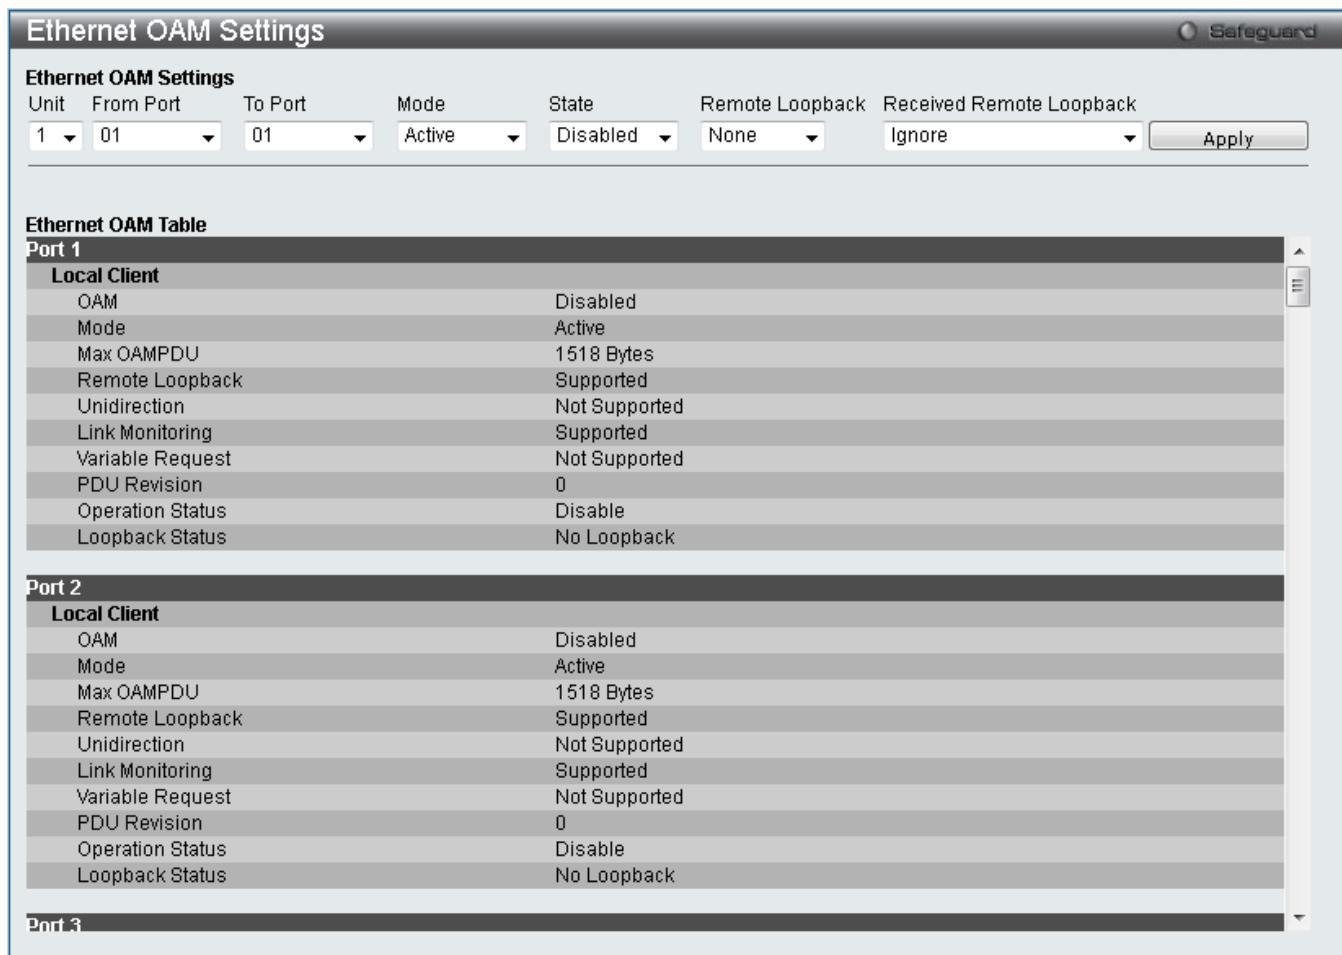

Figure 10-17 Ethernet OAM Settings window

The fields that can be configured are described below:

Parameter	Description
<b>From Port / To Port</b>	Select a range of ports you wish to configure.
<b>Mode</b>	Use the drop-down menu to select to operate in either <i>Active</i> or <i>Passive</i> . The default mode is <i>Active</i> .
<b>State</b>	Use the drop-down menu to enable or disable the OAM function.
<b>Remote Loopback</b>	Use the drop-down menu to select Ethernet OAM remote loopback. <i>None</i> – Select to disable the remote loopback. <i>Start</i> – Select to request the peer to change to the remote loopback mode. <i>Stop</i> - Select to request the peer to change to the normal operation mode.
<b>Received Remote Loopback</b>	Use the drop-down menu to configure the client to process or to ignore the received Ethernet OAM remote loopback command. <i>Process</i> – Select to process the received Ethernet OAM remote loopback command. <i>Ignore</i> - Select to ignore the received Ethernet OAM remote loopback command.

Click the **Apply** button to accept the changes made for each individual section.

## Ethernet OAM Configuration Settings

This window is used to configure Ethernet OAM configuration settings.

To view this window, click **OAM > Ethernet OAM > Ethernet OAM Configuration Settings**, as shown below:

Ethernet OAM Configuration Table	
Port 1	
OAM	Disabled
Mode	Active
Dying Gasp	Enabled
Critical Event	Enabled
Remote Loopback OAMPDU	Not Processed
Symbol Error	
Notify State	Enabled
Window	1000 Milliseconds
Threshold	1 Error Symbol
Frame Error	
Notify State	Enabled
Window	1000 Milliseconds
Threshold	1 Error Frame
Frame Period Error	
Notify State	Enabled
Window	1488100 Frames
Threshold	1 Error Frame
Frame Seconds Error	
Notify State	Enabled

Figure 10-18 Ethernet OAM Configuration Settings window

The fields that can be configured are described below:

Parameter	Description
<b>From Port / To Port</b>	Select a range of ports you wish to configure.
<b>Link Event</b>	Use the drop-down menu to select the link events, <i>Link Monitor</i> or <i>Critical Link Event</i> .
<b>Link Monitor</b>	Use the drop-down menu to select link monitor. Available options are <i>Error Symbol</i> , <i>Error Frame</i> , <i>Error Frame Period</i> , and <i>Error Frame Seconds</i> .
<b>Critical Link Event</b>	Use the drop-down menu to select between <i>Dying Gasp</i> and <i>Critical Event</i> .
<b>Threshold</b>	Enter the number of error frame or symbol in the period is required to be equal to or greater than in order for the event to be generated.
<b>Window</b>	Enter the period of error frame or symbol in milliseconds summary event.

Click the **Apply** button to accept the changes made for each individual section.

## Ethernet OAM Event Log

The window is used to show ports Ethernet OAM event log information.

To view this window, click **OAM > Ethernet OAM > Ethernet OAM Event Log**, as shown below:

The screenshot shows the 'Ethernet OAM Event Log' window. At the top, there are dropdown menus for 'Port' (set to 1) and 'Unit ID' (set to 01), a 'Find' button, and a 'Clear' button. Below these are fields for entering a 'Port List' (e.g., 1:1-1:6) and a checkbox for 'All Ports'. The main area is divided into 'Local Event Statistics' and 'Remote Event Statistics', each listing six types of events with their counts: Error Symbol Event (0), Error Frame Event (0), Error Frame Period Event (0), Error Frame Seconds Event (0), Dying Gasp (0), and Critical Event (0). A summary at the bottom indicates 'Total Entries: 0' and lists columns for 'Index', 'Type', 'Location', 'Time Stamp', 'Value', 'Window', 'Threshold', and 'Accumulated errors'.

Total Entries: 0							
Index	Type	Location	Time Stamp	Value	Window	Threshold	Accumulated errors

Figure 10-19 Ethernet OAM Event Log window

The fields that can be configured are described below:

Parameter	Description
<b>Port</b>	Use the drop-down menu to select the unit ID and the port number to view.
<b>Port List</b>	Enter a list of ports. Tick the <b>All Ports</b> check box to select all ports.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Clear** button to clear all the information entered in the fields.

## Ethernet OAM Statistics

The window is used to show ports Ethernet OAM statistics information.

To view this window, click **OAM > Ethernet OAM > Ethernet OAM Statistics**, as shown below:

Ethernet OAM Statistics					
Unit	1	Clear			
<b>Ethernet OAM Statistics</b>					
<b>Port 1</b>					
Information OAMPDU TX	0	Information OAMPDU RX	0		
Unique Event Notification OAMPDU TX	0	Unique Event Notification OAMPDU RX	0		
Duplicate Event Notification OAMPDU TX	0	Duplicate Event Notification OAMPDU RX	0		
Loopback Control OAMPDU TX	0	Loopback Control OAMPDU RX	0		
Variable Request OAMPDU TX	0	Variable Request OAMPDU RX	0		
Variable Response OAMPDU TX	0	Variable Response OAMPDU RX	0

Variable Request OAMPDU TX	0	Variable Request OAMPDU RX	0		

Figure 10-20 Ethernet OAM Statistics window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Use the drop-down menu to select the unit ID and the port number to view.
<b>Port List</b>	Enter a list of ports. Tick the <b>All Ports</b> check box to select all ports.

Click the **Clear** button to clear all the information entered in the fields.

## DULD Settings

This window is used to configure and display the unidirectional link detection on port.

To view this window, click **OAM > DULD Settings** as shown below:

**DULD Settings**

Unit	From Port	To Port	Admin State	Mode	Discovery Time (5-65535)	<input type="radio"/> Safeguard
1	01	01	Disabled	Normal	5 sec	<input type="button" value="Apply"/>

**Unit 1 Settings**

Port	Admin State	Oper Status	Mode	Link Status	Discovery Time (sec)
1	Disabled	Disabled	Normal	Unknown	5
2	Disabled	Disabled	Normal	Unknown	5
3	Disabled	Disabled	Normal	Unknown	5
4	Disabled	Disabled	Normal	Unknown	5
5	Disabled	Disabled	Normal	Unknown	5
6	Disabled	Disabled	Normal	Unknown	5
7	Disabled	Disabled	Normal	Unknown	5
8	Disabled	Disabled	Normal	Unknown	5
9	Disabled	Disabled	Normal	Unknown	5
10	Disabled	Disabled	Normal	Unknown	5
11	Disabled	Disabled	Normal	Unknown	5
12	Disabled	Disabled	Normal	Unknown	5

**Figure 10-21 DULD Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Select a range of ports you wish to configure.
<b>Admin State</b>	Use the drop-down menu to enable or disable the selected ports unidirectional link detection status.
<b>Mode</b>	Use the drop-down menu to select Mode between <i>Shutdown</i> and <i>Normal</i> . <i>Shutdown</i> – If any unidirectional link is detected, disable the port and log an event. <i>Normal</i> - Only log an event when a unidirectional link is detected.
<b>Discovery Time (5-65535)</b>	Enter these ports neighbor discovery time. If the discovery is timeout, the unidirectional link detection will start.

Click the **Apply** button to accept the changes made.

## Cable Diagnostics

The cable diagnostics feature is designed primarily for administrators or customer service representatives to verify and test copper cables; it can rapidly determine the quality of the cables and the types of error.

To view this window, click **OAM > Cable Diagnostics** as shown below:

**Cable Diagnostics**

Unit **1** Port **21** **Test**

Port	Type	Link Status	Test Result	Cable Length (M)
21	1000BASE-T	Link Up	OK	5

The cable diagnostics feature is designed primarily for administrators or customer service representatives to verify and test copper cables; it can rapidly determine the quality of the cables and the types of error.

**Note:**

1. If cable length is displayed as "NA" it means the cable length is "Not Available". This is due to the port being unable to obtain cable length/either because its link partner is powered-off, or the cables used are broken and/or bad in quality.
2. The maximum cable length is limited to 120 meters.
3. The accuracy is +/- 5 meters, therefore "No Cable" may be displayed under "Test Result", when the length of cable is less than 5 meters.
4. It also measures cable fault and identifies the fault in length according to the distance from this switch.

**Figure 10-22 Cable Diagnostics window**

To view the cable diagnostics for a particular port, use the drop-down menu to choose the **Unit ID** and **Port** and click **Test**. The information will be displayed in this window.

**NOTE:** Cable diagnostic function limitations. Cable length detection is only supported on GE ports. Ports must be linked up and running at 1000M speed. Cross-talk errors detection is not supported on FE ports.

**NOTE:** The available cable diagnosis length is from 5 to 120 meters.

**NOTE:** The deviation of cable length detection is +/- 5M for GE ports.

#### **Fault messages:**

- *Open* - This pair is left open.
- *Short* - Two lines of this pair is shorted.
- *CrossTalk* - Lines of this pair is short with lines in other pairs.
- *Unknown* - The diagnosis does not obtain the cable status, please try again.
- *NA* - No cable was found, maybe it's because cable is out of diagnosis specification or the quality is too bad.

**Peripheral**

## Utilization

### CPU Utilization

This window is used to display the percentage of the CPU being used, expressed as an integer percentage and calculated as a simple average by time interval.

To view this window, click **Monitoring > Utilization > CPU Utilization** as shown below:

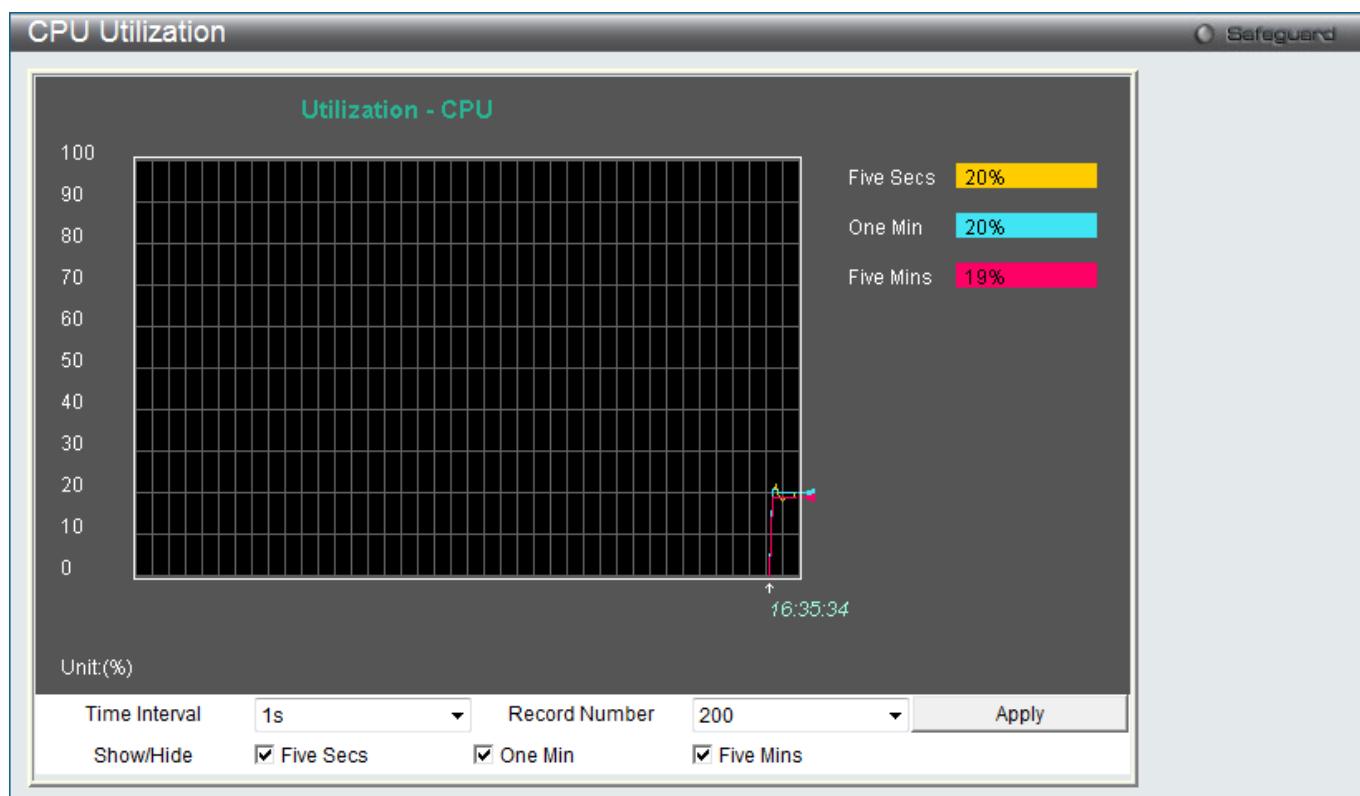

Figure 11-1 CPU Utilization window

To view the CPU utilization by port, use the real-time graphic of the Switch and/or switch stack at the top of the web page by simply clicking on a port. Click **Apply** to implement the configured settings. The window will automatically refresh with new updated statistics.

The fields that can be configured are described below:

Parameter	Description
<b>Time Interval</b>	Select the desired setting between 1s and 60s, where "s" stands for seconds. The default value is one second.
<b>Record Number</b>	Select number of times the Switch will be polled between 20 and 200. The default value is 200.
<b>Show/Hide</b>	Check whether or not to display Five Seconds, One Minute, and Five Minutes.

Click the **Apply** button to accept the changes made.

## DRAM & Flash Utilization

This window is used to display information regarding the DRAM and Flash utilization.

To view this window, click **Monitoring > Utilization > DRAM & Flash Utilization** as shown below:

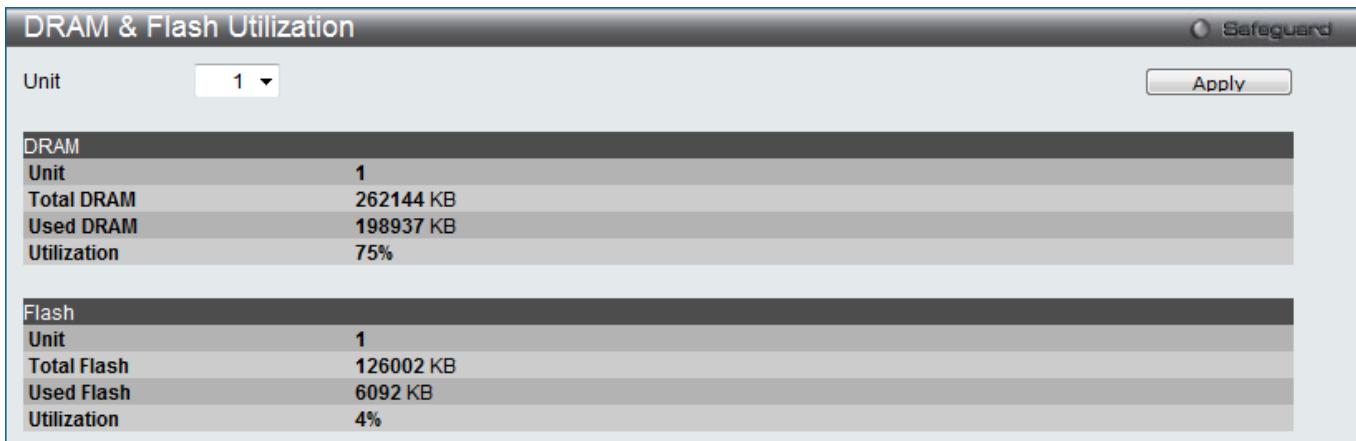

Figure 11-2 DRAM & Flash Utilization window

## Port Utilization

This window is used to display the percentage of the total available bandwidth being used on the port.

To view this window, click **Monitoring > Utilization > Port Utilization** as shown below:

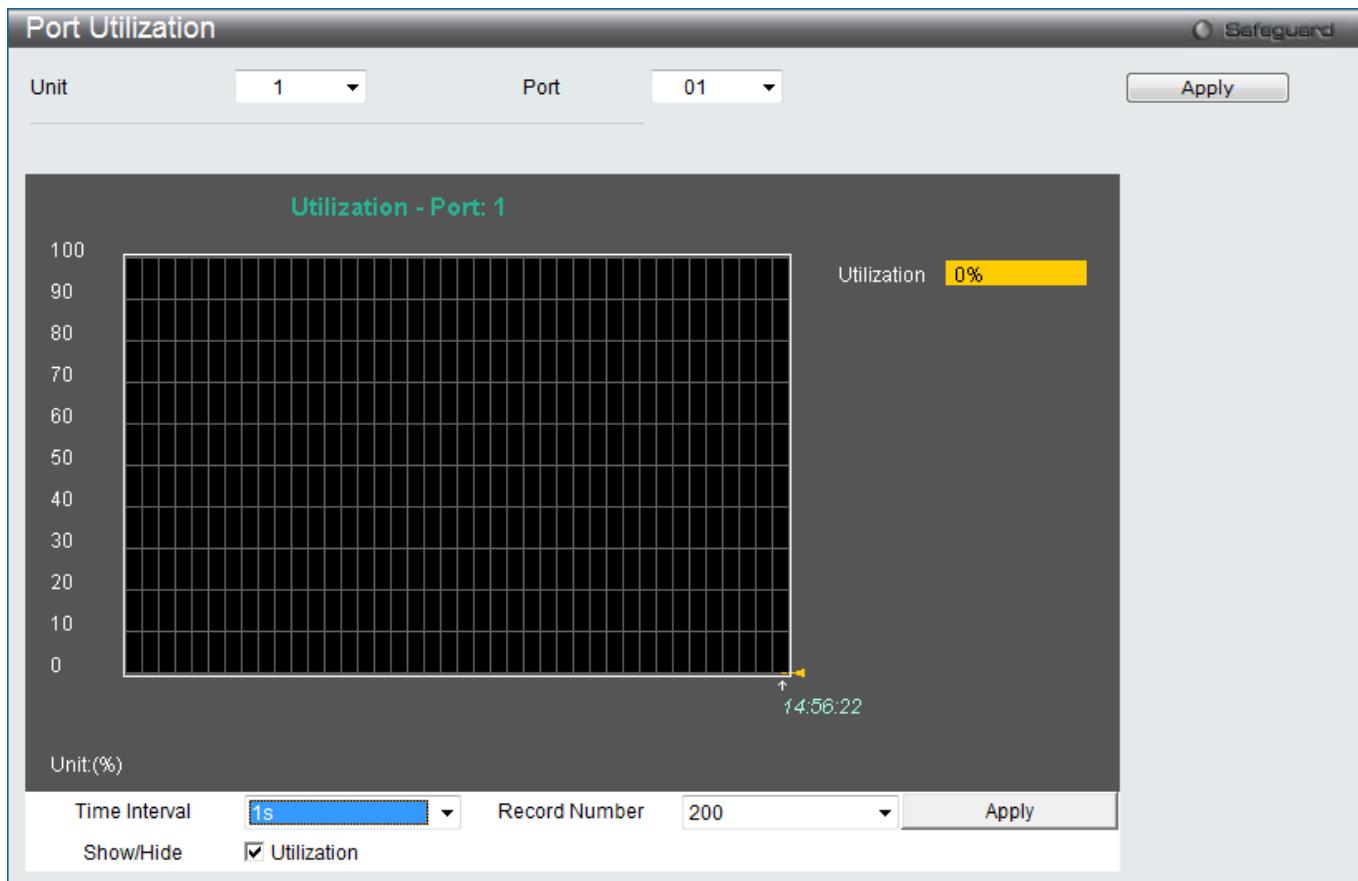

Figure 11-3 Port Utilization window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Use the drop-down menu to choose the port that will display statistics.
<b>Time Interval</b>	Select the desired setting between 1s and 60s, where "s" stands for seconds. The default value is one second.
<b>Record Number</b>	Select number of times the Switch will be polled between 20 and 200. The default value is 200.
<b>Show/Hide</b>	Check whether or not to display Port Util.

Click the **Apply** button to accept the changes made for each individual section.

## Statistics

### Port Statistics

#### Packets

The Web manager allows various packet statistics to be viewed as either a line graph or a table. Six windows are offered.

## Received (RX)

To select a port to view these statistics for, select the port by using the Port drop-down menu. The user may also use the real-time graphic of the Switch at the top of the web page by simply clicking on a port.

To view this window, click **Monitoring > Statistics > Port Statistics > Packets > Received (RX)** as shown below:

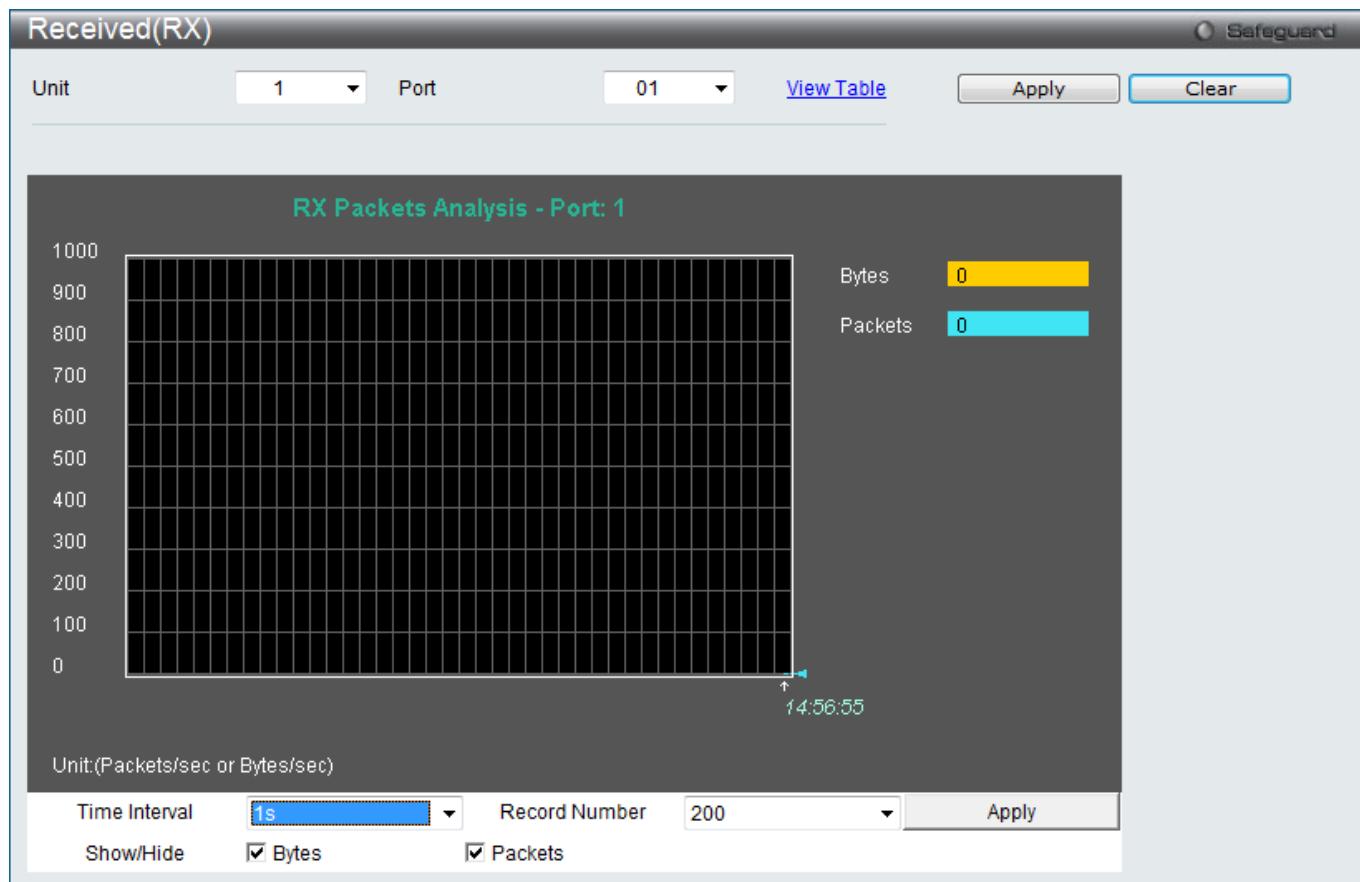

Figure 11-4 Received (RX) window (for Bytes and Packets)

Click the [View Table](#) link to display the information in a table rather than a line graph.

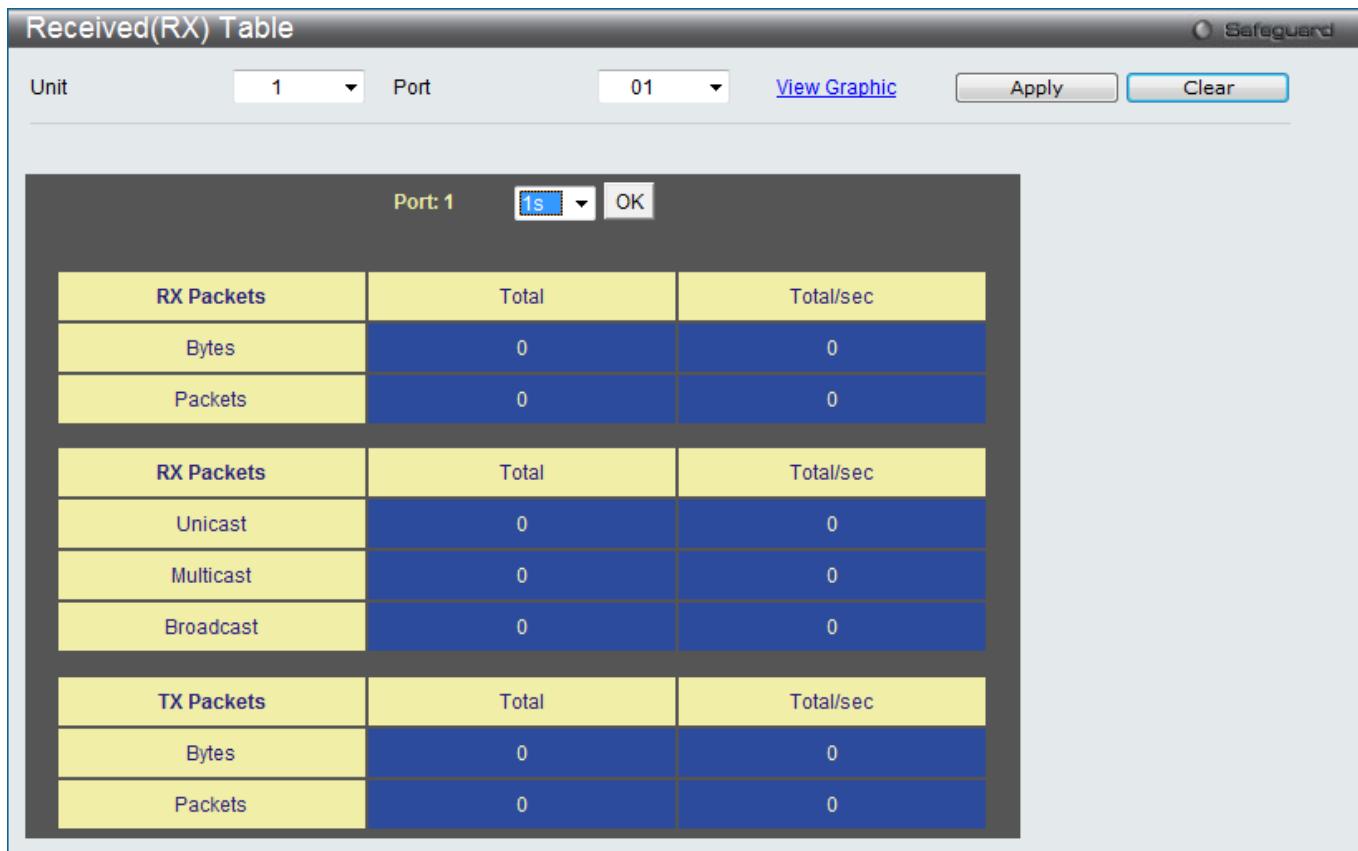

Figure 11-5 RX Packets Analysis Table window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Use the drop-down menu to choose the port that will display statistics.
<b>Time Interval</b>	Select the desired setting between 1s and 60s, where "s" stands for seconds. The default value is one second.
<b>Record Number</b>	Select number of times the Switch will be polled between 20 and 200. The default value is 200.
<b>Bytes</b>	Counts the number of bytes received on the port.
<b>Packets</b>	Counts the number of packets received on the port.
<b>Unicast</b>	Counts the total number of good packets that were received by a unicast address.
<b>Multicast</b>	Counts the total number of good packets that were received by a multicast address.
<b>Broadcast</b>	Counts the total number of good packets that were received by a broadcast address.
<b>Show/Hide</b>	Check whether to display Bytes and Packets.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Clear** button to clear all statistics counters on this window.

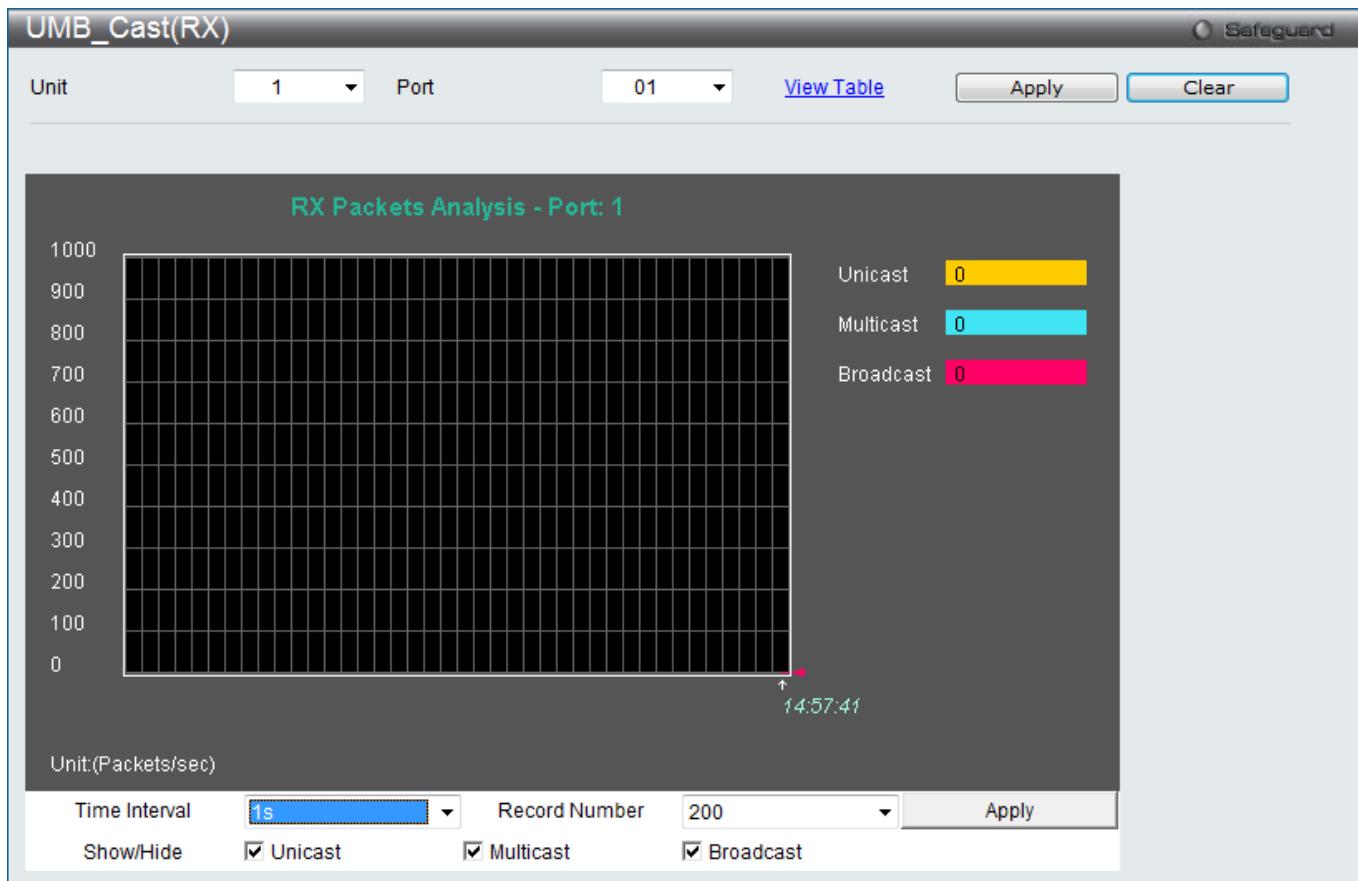

Click the [View Table](#) link to display the information in a table rather than a line graph.

Click the [View Graphic](#) link to display the information in a line graph rather than a table.

## UMB\_Cast (RX)

To select a port to view these statistics for, select the port by using the Port drop-down menu. The user may also use the real-time graphic of the Switch at the top of the web page by simply clicking on a port.

To view this window, click **Monitoring > Statistics > Port Statistics > Packets > UMB\_Cast (RX)** as shown below:

**Figure 11-6 UMB\_cast (RX) window (for Unicast, Multicast, and Broadcast Packets)**

Click the [View Table](#) link to display the information in a table rather than a line graph.

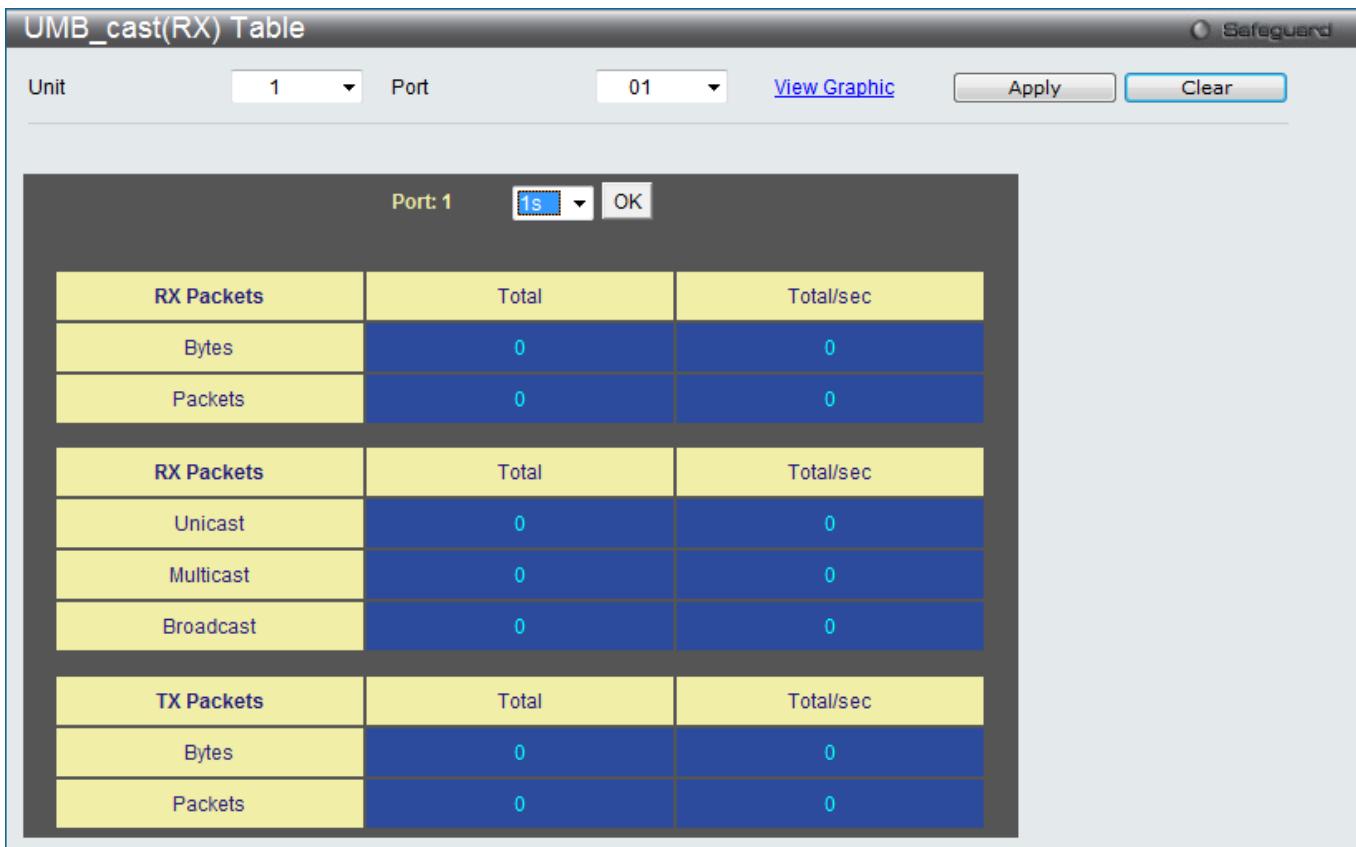

Figure 11-7 RX Packets Analysis window (table for Unicast, Multicast, and Broadcast Packets)

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Use the drop-down menu to choose the port that will display statistics.
<b>Time Interval</b>	Select the desired setting between 1s and 60s, where "s" stands for seconds. The default value is one second.
<b>Record Number</b>	Select number of times the Switch will be polled between 20 and 200. The default value is 200.
<b>Unicast</b>	Counts the total number of good packets that were received by a unicast address.
<b>Multicast</b>	Counts the total number of good packets that were received by a multicast address.
<b>Broadcast</b>	Counts the total number of good packets that were received by a broadcast address.
<b>Show/Hide</b>	Check whether or not to display Multicast, Broadcast, and Unicast Packets.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Clear** button to clear all statistics counters on this window.

Click the [View Table](#) link to display the information in a table rather than a line graph.

Click the [View Graphic](#) link to display the information in a line graph rather than a table.

## Transmitted (TX)

To select a port to view these statistics for, select the port by using the Port drop-down menu. The user may also use the real-time graphic of the Switch at the top of the web page by simply clicking on a port.

To view this window, click **Monitoring > Statistics > Port Statistics > Packets > Transmitted (TX)** as shown below:

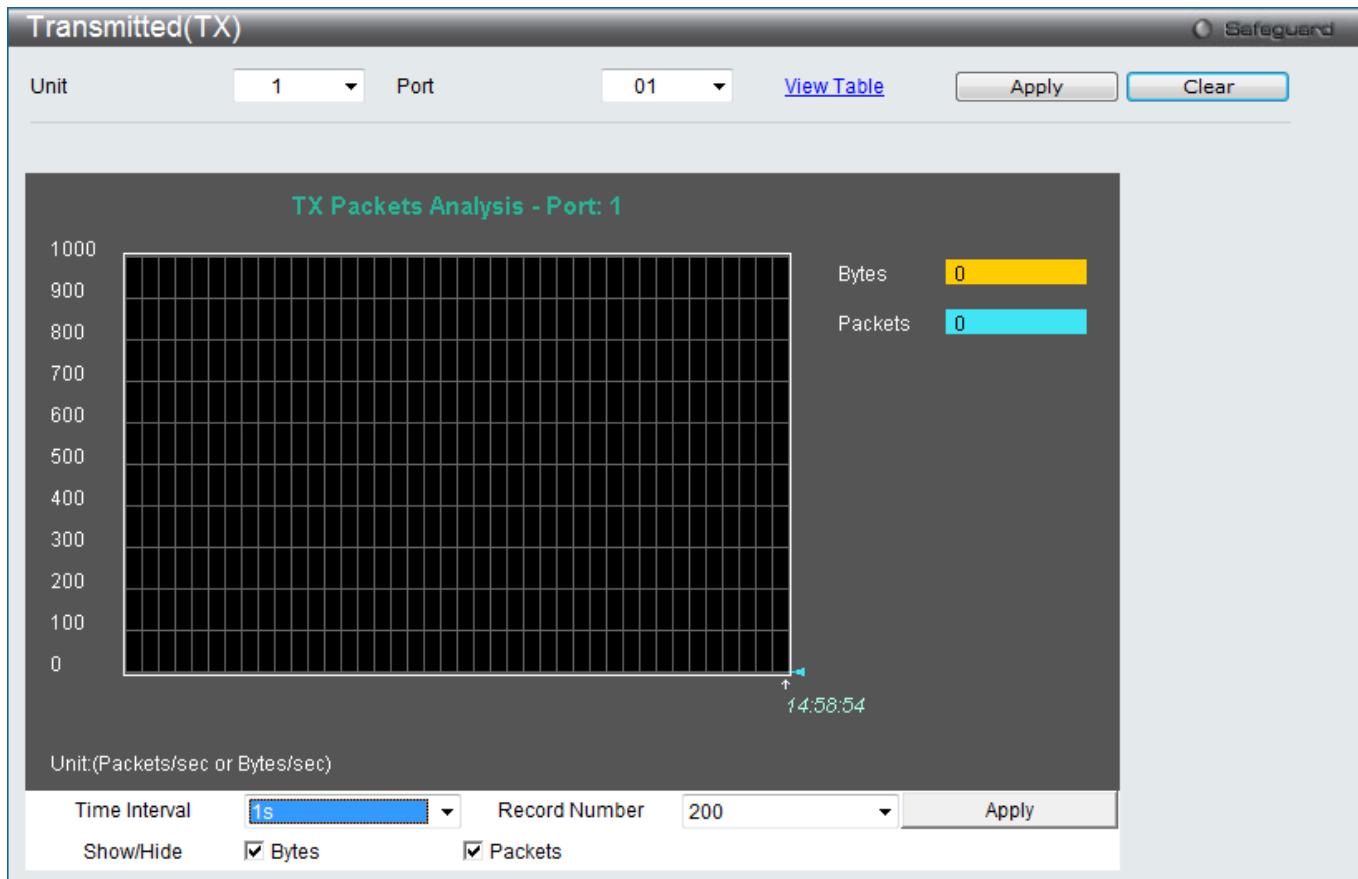

Figure 11-8 Transmitted (TX) window (for Bytes and Packets)

Click the [View Table](#) link to display the information in a table rather than a line graph.

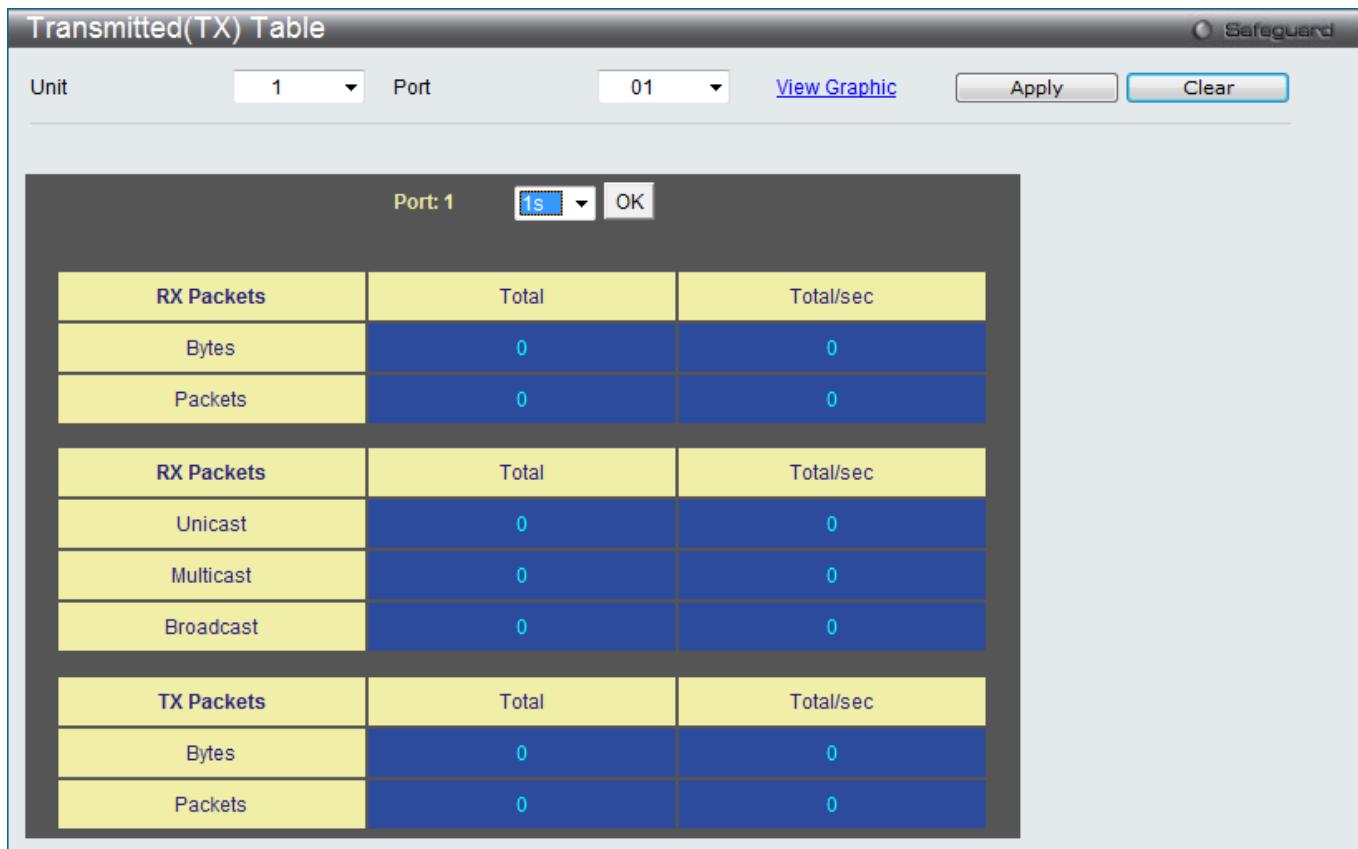

Figure 11-9 TX Packets Analysis window (table for Bytes and Packets)

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Use the drop-down menu to choose the port that will display statistics.
<b>Time Interval</b>	Select the desired setting between 1s and 60s, where "s" stands for seconds. The default value is one second.
<b>Record Number</b>	Select number of times the Switch will be polled between 20 and 200. The default value is 200.
<b>Bytes</b>	Counts the number of bytes successfully sent on the port.
<b>Packets</b>	Counts the number of packets successfully sent on the port.
<b>Unicast</b>	Counts the total number of good unicast packets.
<b>Multicast</b>	Counts the total number of good multicast packets.
<b>Broadcast</b>	Counts the total number of good broadcast packets.
<b>Show/Hide</b>	Check whether or not to display Bytes and Packets.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Clear** button to clear all statistics counters on this window.

Click the [View Table](#) link to display the information in a table rather than a line graph.

Click the [View Graphic](#) link to display the information in a line graph rather than a table.

## Errors

The Web manager allows port error statistics compiled by the Switch's management agent to be viewed as either a line graph or a table. Four windows are offered.

### Received (RX)

To select a port to view these statistics for, select the port by using the Port drop-down menu. The user may also use the real-time graphic of the Switch at the top of the web page by simply clicking on a port.

To view this window, click **Monitoring > Statistics > Port Statistics > Errors > Received (RX)** as shown below:

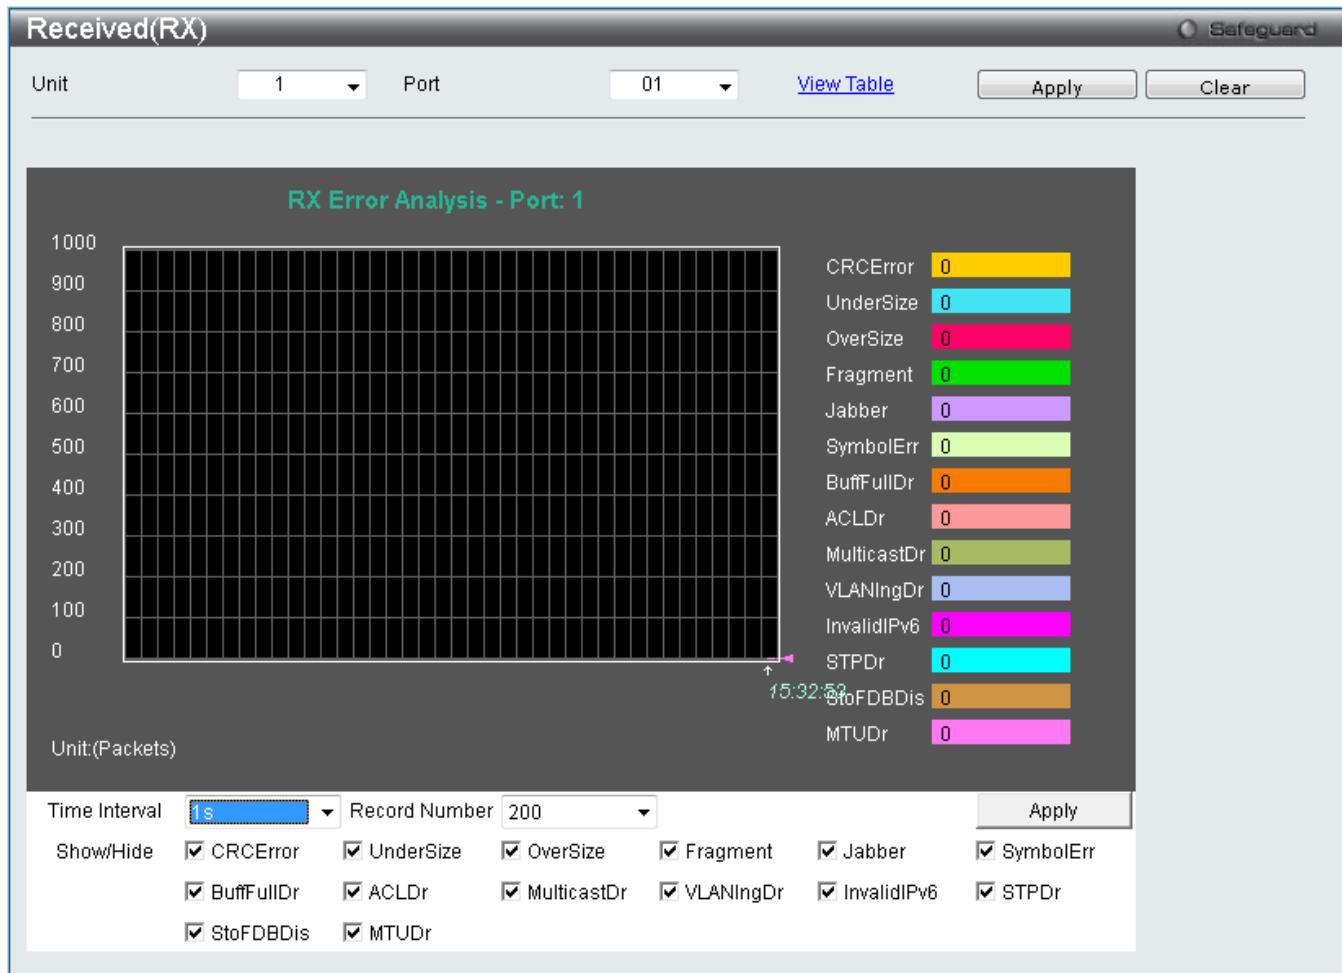

Figure 11-10 Received (RX) window (for errors)

Click the [View Table](#) link to display the information in a table rather than a line graph.

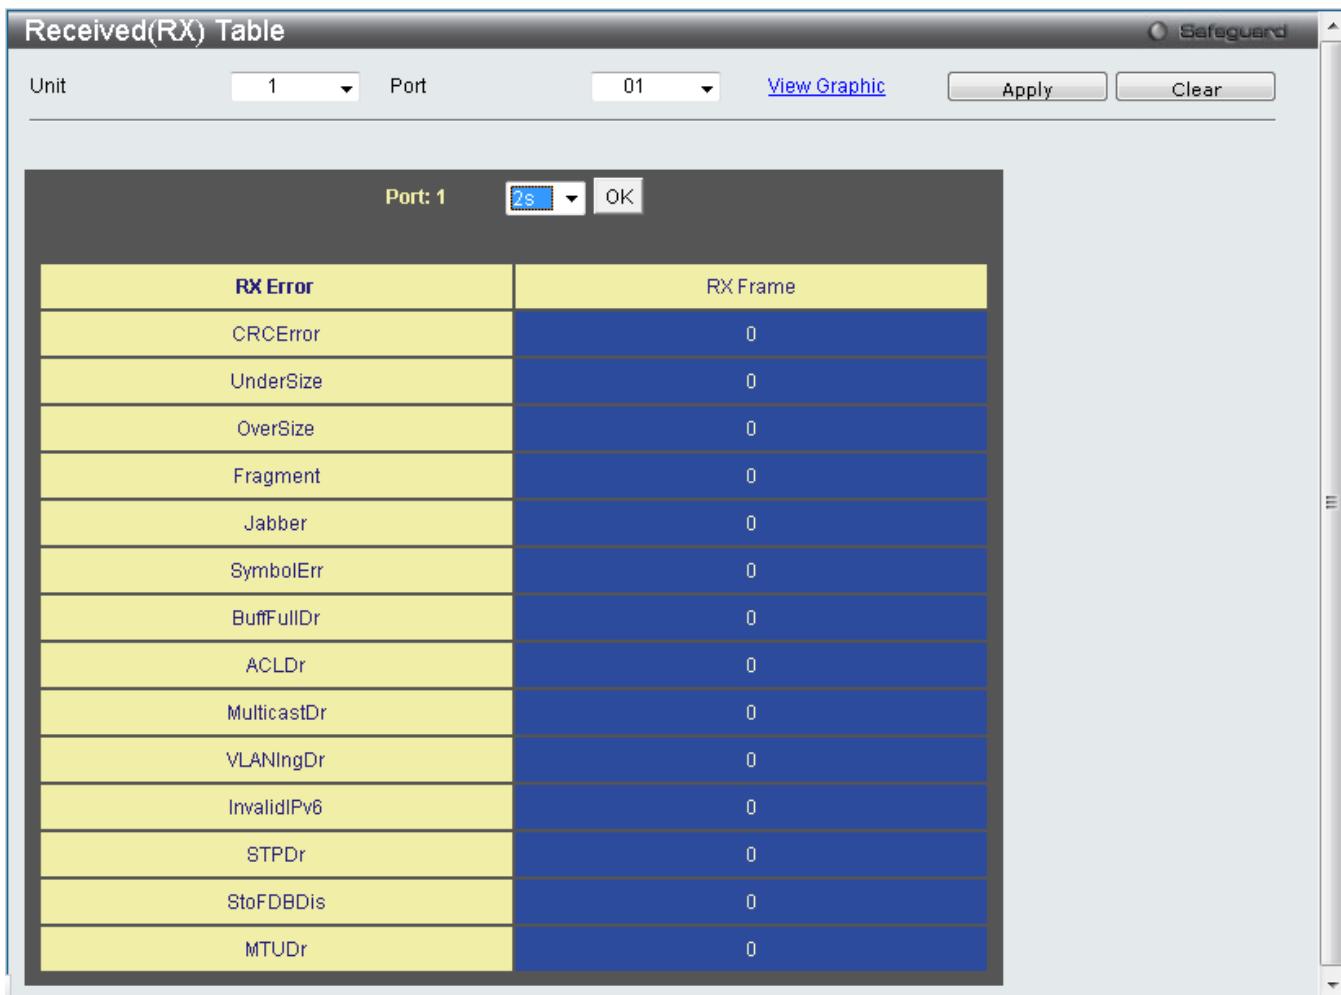

Figure 11-11 RX Error Analysis window (table)

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Use the drop-down menu to choose the port that will display statistics.
<b>Time Interval</b>	Select the desired setting between 1s and 60s, where "s" stands for seconds. The default value is one second.
<b>Record Number</b>	Select number of times the Switch will be polled between 20 and 200. The default value is 200.
<b>CRCError</b>	Counts otherwise valid packets that did not end on a byte (octet) boundary.
<b>UnderSize</b>	The number of packets detected that are less than the minimum permitted packets size of 64 bytes and have a good CRC. Undersize packets usually indicate collision fragments, a normal network occurrence.
<b>OverSize</b>	Counts valid packets received that were longer than 1518 octets and less than the MAX_PKT_LEN. Internally, MAX_PKT_LEN is equal to 1536.
<b>Fragment</b>	The number of packets less than 64 bytes with either bad framing or an invalid CRC. These are normally the result of collisions.

<b>Jabber</b>	Counts invalid packets received that were longer than 1518 octets and less than the MAX_PKT_LEN. Internally, MAX_PKT_LEN is equal to 1536.
<b>SymbolErr</b>	Counts the number of packets received that have errors received in the symbol on the physical layer.
<b>BuffFullDr</b>	Buffer Full Drop - Incremented for each packet that is discarded while the input buffer is full.
<b>ACLDr</b>	ACL Drop - Incremented for each packet that is denied by ACLs.
<b>MulticastDr</b>	Multicast Drop - Incremented for each multicast packet that is discarded.
<b>VLANIngressDr</b>	VLAN Ingress Drop - Incremented for each packet that is discarded by VLAN ingress checking.
<b>InvalidIPv6</b>	Invalid IPv6 - Increment counter for IPv6 Layer 3 discards.
<b>STPDr</b>	STP Drop - Increment counter for packets dropped when the ingress port is not in the forwarding state.
<b>StoFDBDis</b>	Storm and FDB Discard - Increment counter for received policy discards.
<b>MTUDr</b>	MTU Drop - Receive MTU Check Error Frame Counter. Incremented for frames received, which exceeds the MAXFR (Maximum Frame) in length and contains a valid or invalid FCS.
<b>Show/Hide</b>	Check whether or not to display CRCError, UnderSize, OverSize, Fragment, Jabber, Drop, and SymbolErr errors.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Clear** button to clear all statistics counters on this window.

Click the [View Table](#) link to display the information in a table rather than a line graph.

Click the [View Graphic](#) link to display the information in a line graph rather than a table.

## Transmitted (TX)

To select a port to view these statistics for, select the port by using the Port drop-down menu. The user may also use the real-time graphic of the Switch at the top of the web page by simply clicking on a port.

To view this window, click **Monitoring > Statistics > Port Statistics > Errors > Transmitted (TX)** as shown below:

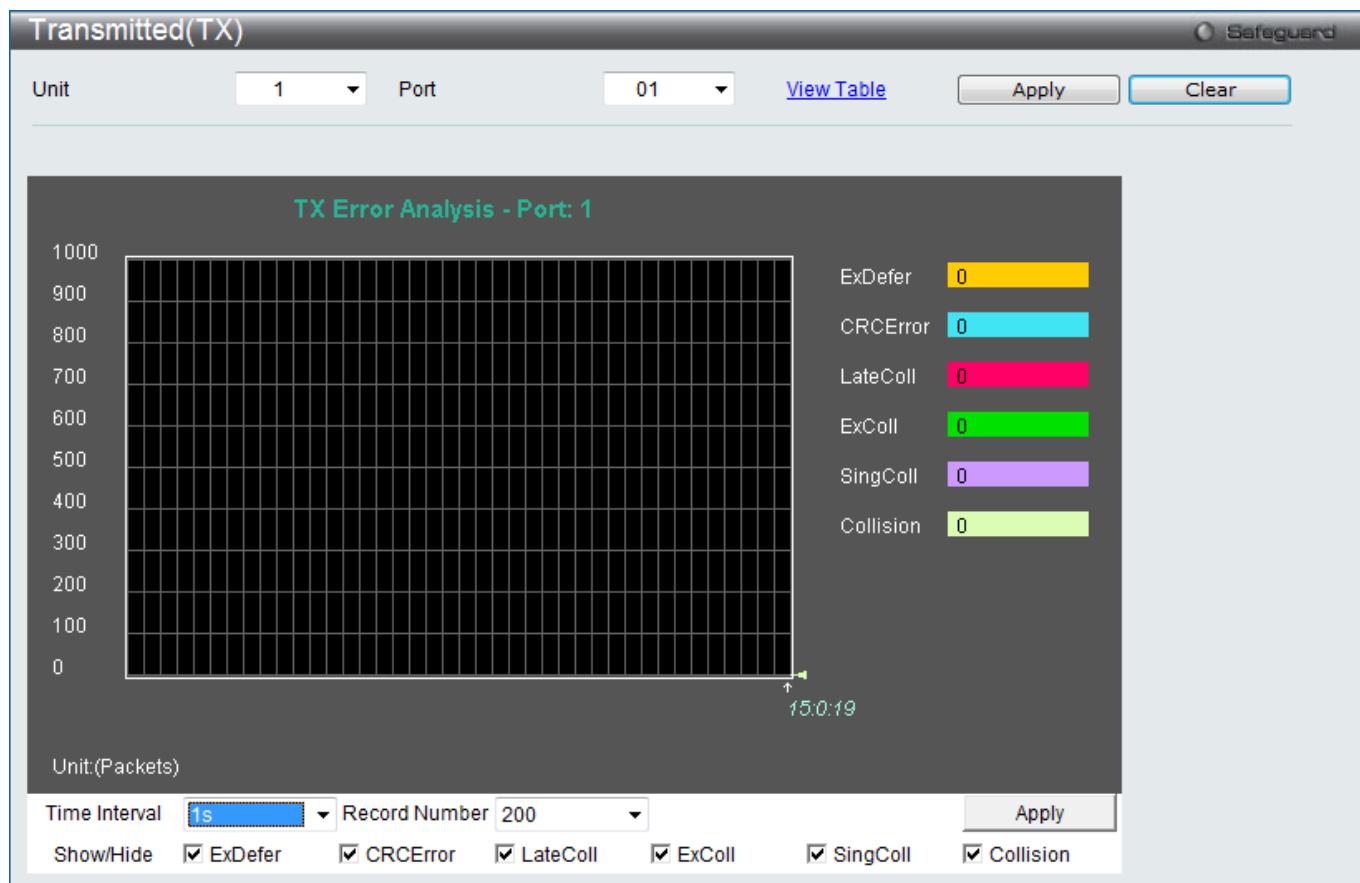

Figure 11-12 Transmitted (TX) window (for errors)

Click the [View Table](#) link to display the information in a table rather than a line graph.

The figure shows the TX Error Analysis window for Port 1. It has a 'View Graphic' button at the top, followed by a table with the following data:

TX Error	TX Frames
ExDefer	0
CRC Error	0
LateColl	0
ExColl	0
SingColl	0
Collision	0

Figure 11-13 TX Error Analysis window (table)

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Use the drop-down menu to choose the port that will display statistics.
<b>Time Interval</b>	Select the desired setting between 1s and 60s, where "s" stands for seconds. The default value is one second.
<b>Record Number</b>	Select number of times the Switch will be polled between 20 and 200. The default value is 200.
<b>ExDefer</b>	Counts the number of packets for which the first transmission attempt on a particular interface was delayed because the medium was busy.
<b>CRC Error</b>	Counts otherwise valid packets that did not end on a byte (octet) boundary.
<b>LateColl</b>	Counts the number of times that a collision is detected later than 512 bit-times into the transmission of a packet.
<b>ExColl</b>	Excessive Collisions. The number of packets for which transmission failed due to excessive collisions.
<b>SingColl</b>	Single Collision Frames. The number of successfully transmitted packets for which transmission is inhibited by more than one collision.
<b>Collision</b>	An estimate of the total number of collisions on this network segment.
<b>Show/Hide</b>	Check whether or not to display ExDefer, CRCError, LateColl, ExColl, SingColl, and Collision errors.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Clear** button to clear all statistics counters on this window.

Click the [View Table](#) link to display the information in a table rather than a line graph.

Click the [View Graphic](#) link to display the information in a line graph rather than a table.

## Packet Size

Users can display packets received by the Switch, arranged in six groups and classed by size, as either a line graph or a table. Two windows are offered. To select a port to view these statistics for, select the port by using the Port drop-down menu. The user may also use the real-time graphic of the Switch at the top of the web page by simply clicking on a port.

To view this window, click **Monitoring > Statistics > Packet Size** as shown below:

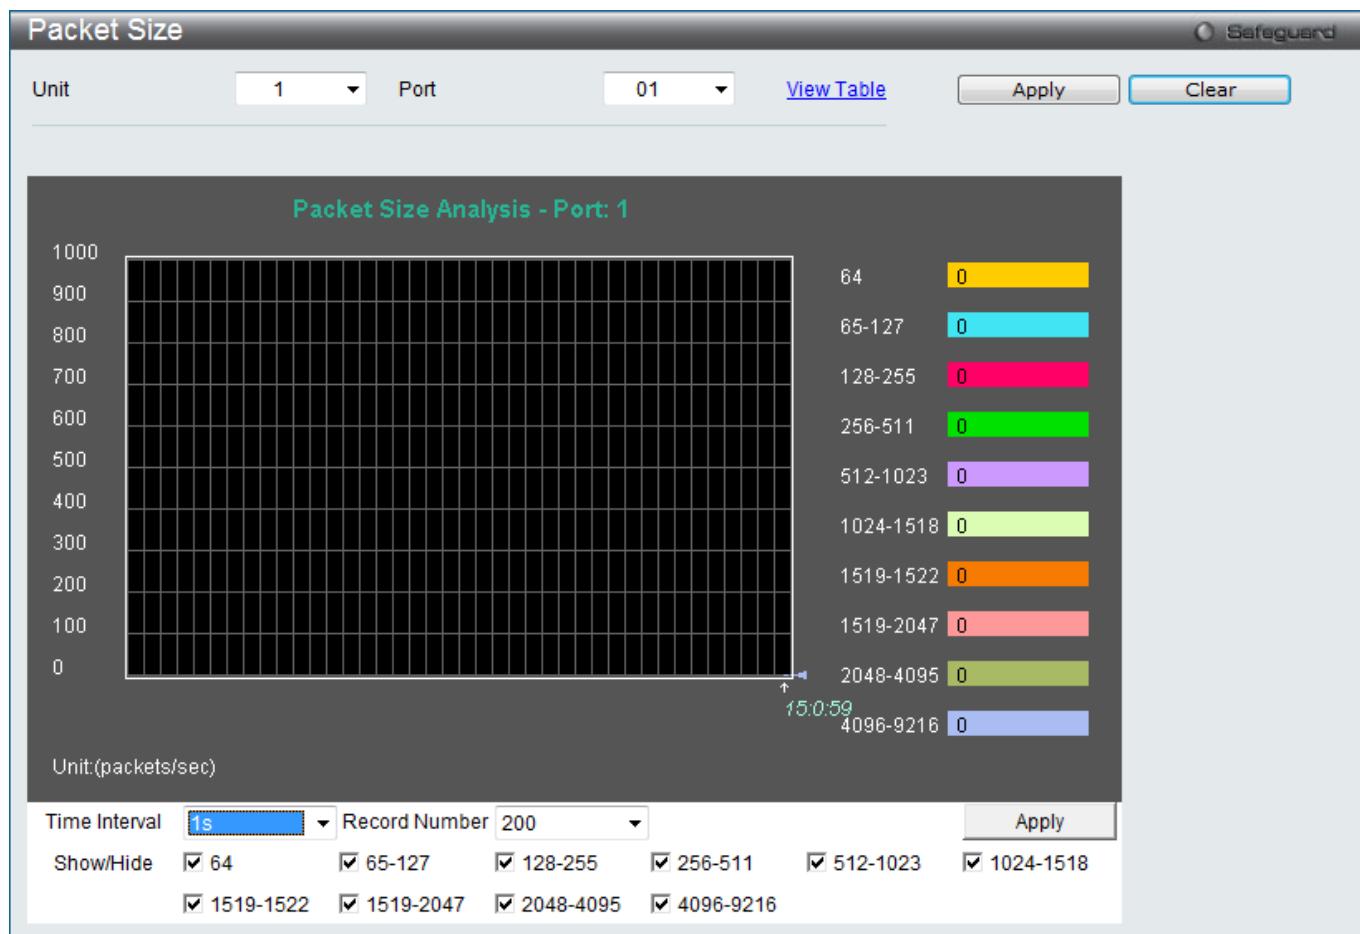

Figure 11-14 Packet Size window

Click the [View Table](#) link to display the information in a table rather than a line graph.

The screenshot shows the 'Packet Size Table' window for Port 1. At the top, there are dropdown menus for 'Unit' (set to 1) and 'Port' (set to 01), and buttons for 'View Graphic', 'Apply', and 'Clear'. Below this is a table titled 'Port: 1' with a 'Time Interval' dropdown set to 1s and an 'OK' button. The table has three columns: 'Frame Size', 'Frame Counts', and 'Frames/sec'. All values are currently 0.

Frame Size	Frame Counts	Frames/sec
64	0	0
65-127	0	0
128-255	0	0
256-511	0	0
512-1023	0	0
1024-1518	0	0
1519-1522	0	0
1519-2047	0	0
2048-4095	0	0
4096-9216	0	0

Figure 11-15 RX Size Analysis window (table)

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>Port</b>	Use the drop-down menu to choose the port that will display statistics.
<b>Time Interval</b>	Select the desired setting between 1s and 60s, where "s" stands for seconds. The default value is one second.
<b>Record Number</b>	Select number of times the Switch will be polled between 20 and 200. The default value is 200.
<b>64</b>	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
<b>65-127</b>	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).
<b>128-255</b>	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
<b>256-511</b>	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
<b>512-1023</b>	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
<b>1024-1518</b>	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets).
<b>1519-1522</b>	The total number of packets (including bad packets) received that were between 1519 and 1522 octets in length inclusive (excluding framing bits but including FCS octets).
<b>1519-2047</b>	The total number of packets (including bad packets) received that were between 1519 and 2047 octets in length inclusive (excluding framing bits but including FCS octets).
<b>2048-4095</b>	The total number of packets (including bad packets) received that were between 2048 and 4095 octets in length inclusive (excluding framing bits but including FCS octets).
<b>4096-9216</b>	The total number of packets (including bad packets) received that were between 4096 and 9216 octets in length inclusive (excluding framing bits but including FCS octets).
<b>Show/Hide</b>	Check whether or not to display 64, 65-127, 128-255, 256-511, 512-1023, 1024-1518, 1519-1522, 1519-2047, 2048-1095 and 4096-9216 packets received.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Clear** button to clear all statistics counters on this window.

Click the [View Table](#) link to display the information in a table rather than a line graph.

Click the [View Graphic](#) link to display the information in a line graph rather than a table.

## Mirror

The Switch allows you to copy frames transmitted and received on a port and redirect the copies to another port. You can attach a monitoring device to the mirroring port, such as a sniffer or an RMON probe, to view details about the packets passing through the mirrored port. This is useful for network monitoring and troubleshooting purposes.

## Port Mirror Settings

To view this window, click **Monitoring > Mirror > Port Mirror Settings** as shown below:

The screenshot shows the 'Port Mirror Settings' window. At the top left is a 'Safeguard' icon. Below it, under 'Mirror Global Settings', the 'Mirror Global State' is set to 'Enabled'. To the right are 'Apply' and 'Find' buttons. Under 'Port Mirror Settings', there is a 'Group ID (1-4)' input field with a blue border, and 'Apply' and 'Find' buttons. A 'View All' link is located below these buttons. A table lists one mirror entry: Group 1 is Enabled, Target Port is 1, RX Source Ports are 2-5, and TX Source Ports are 2-5. Buttons for 'Modify' and 'Delete' are to the right of the table.

**Figure 11-16 Port Mirror Settings window**

The fields that can be configured are described below:

Parameter	Description
<b>Mirror Global State</b>	Click the radio buttons to enable or disable the Port Mirroring feature.
<b>Group ID (1-4)</b>	Enter a mirror group ID.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **View All** button to display all the existing entries.

Click the **Modify** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

Click the **Modify** button to see the following window.

The screenshot shows the 'Port Mirror Edit' window. It includes fields for 'Group ID' (set to 1), 'Target Port' (Unit 1, Port 01), 'Source Ports' (e.g.: 1:1-1:4) with an input field and dropdown for direction (RX, TX, Both), and checkboxes for 'Add' and 'Delete'. Below these are 'State' dropdowns for 'Enabled' and 'Disabled'. At the bottom are '<<Back' and 'Apply' buttons.

**Figure 11-17 Port Mirror Settings - Modify window**

The fields that can be configured are described below:

Parameter	Description
<b>Target Port</b>	Here the user can select the <b>Unit</b> and <b>Target Port</b> used for Port Mirroring.
<b>Source Ports</b>	Enter the ports that will be mirrored. Select <b>RX</b> , <b>TX</b> or <b>Both</b> to specify in which direction the packets will be monitored. Tick <b>Add</b> or <b>Delete</b> to add or delete source ports.
<b>State</b>	Enable or disable the mirror group function.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

**NOTE:** You cannot mirror a fast port onto a slower port. For example, if you try to mirror the traffic from a 100 Mbps port onto a 10 Mbps port, this can cause throughput problems. The port you are copying frames from should always support an equal or lower speed than the port to which you are sending the copies. Please note a target port and a source port cannot be the same port.

## RSPAN Settings

This page controls the RSPAN function. The purpose of the RSPAN function is to mirror packets to a remote switch. A packet travels from the switch where the monitored packet is received, passing through the intermediate switch, and then to the switch where the sniffer is attached. The first switch is also named the source switch.

To make the RSPAN function work, the RSPAN VLAN source setting must be configured on the source switch. For the intermediate and the last switch, the RSPAN VLAN redirect setting must be configured.

**NOTE:** RSPAN VLAN mirroring will only work when RSPAN is enabled (when one RSPAN VLAN has been configured with a source port). The RSPAN redirect function will work when RSPAN is enabled and at least one RSPAN VLAN has been configured with redirect ports.

To view this window, click **Monitoring > Mirror > RSPAN Settings** as shown below:

The screenshot shows the 'RSPAN Settings' window. At the top, there is a 'RSPAN Global Settings' section with a 'RSPAN State' radio button set to 'Enabled'. Below this are fields for 'VLAN Name' (with a max of 32 characters) and 'VID (1-4094)'. There are 'Add' and 'Find' buttons. The main area shows a table with one entry:

Total Entries: 1					
VID	Group ID	Target Port	RX Source Ports	TX Source Ports	Redirect Ports
2	1	1	2-7	2-7	<a href="#">Modify</a> <a href="#">Delete</a>

Figure 11-18 RSPAN Settings window

The fields that can be configured are described below:

Parameter	Description
<b>RSPAN State</b>	Click the radio buttons to enable or disable the RSPAN feature.
<b>VLAN Name</b>	Create the RSPAN VLAN by VLAN name.
<b>VID (1-4094)</b>	Create the RSPAN VLAN by VLAN ID.

Click the **Apply** button to accept the changes made.

Click the **Add** button to add a new entry based on the information entered.

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Modify** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

After clicking the **Modify** button, the following page will appear:

The screenshot shows the 'RSPAN Settings' window. At the top left is the title 'RSPAN Settings'. On the right is a 'Safeguard' button. Below the title is a table titled 'RSPAN Settings Table'. The table has two rows. The first row contains fields for 'VID' (set to 2), 'VLAN Name' (set to v2), 'Source' (radio button selected), 'PortList' (dropdown set to 2-7), 'RX' (selected from a dropdown menu), and buttons for 'Add' and 'Delete'. The second row contains a 'Group ID' field (set to 1) and buttons for 'Add' and 'Delete'. At the bottom of the table are 'Back' and 'Apply' buttons.

Figure 11-19 RSPAN Settings – Modify window

The fields that can be configured are described below:

Parameter	Description
<b>Source Ports</b>	If the ports are not specified by option, the source of RSPAN will come from the source specified by the mirror command or the flow-based source specified by an ACL. Select <b>RX</b> , <b>TX</b> or <b>Both</b> to specify in which direction the packets will be monitored. Click <b>Add</b> or <b>Delete</b> to add or delete source ports.
<b>Redirect Port List</b>	Specify the output port list for the RSPAN VLAN packets. If the redirect port is a Link Aggregation port, the Link Aggregation behavior will apply to the RSPAN packets. Click <b>Add</b> or <b>Delete</b> to add or delete redirect ports.

Click the **Apply** button to accept the changes made.

Click the **<<Back** button to discard the changes made and return to the previous page.

## sFlow

sFlow (RFC3176) is a technology for monitoring traffic in data networks containing switches and routers. The sFlow monitoring system consists of an sFlow Agent (embedded in a switch or router or in a standalone probe) and a central sFlow Collector. The architecture and sampling techniques used in the sFlow monitoring system were designed for providing continuous site-wide (and enterprise-wide) traffic monitoring of high speed switched and routed networks.

## sFlow Global Settings

This window is used to enable or disable the sFlow feature.

To view this window, click **Monitoring > sFlow > sFlow Global Settings** as shown below:

The screenshot shows the 'sFlow Global Settings' window. At the top left is the title 'sFlow Global Settings'. On the right is a 'Safeguard' button. Below the title is a section titled 'sFlow Global Settings' with a 'sFlow State' field where 'Disabled' is selected. At the bottom right is an 'Apply' button. Below this section is a table with four rows: 'sFlow Version' (v5), 'sFlow Address' (10.90.90.90), 'sFlow IPv6 Address' (A5A:5A5A::), and 'sFlow State' (Disabled).

Figure 11-20 sFlow Global Settings window

The fields that can be configured are described below:

Parameter	Description
sFlow State	Click the radio buttons to enable or disable the sFlow feature.

Click the **Apply** button to accept the changes made.

## sFlow Analyzer Server Settings

The Switch can support 4 different Analyzer Servers at the same time and each sampler or poller can select a collector to send the samples. We can send different samples from different samplers or pollers to different collectors.

To view this window, click **Monitoring > sFlow > sFlow Analyzer Server Settings** as shown below:

The screenshot shows the 'sFlow Analyzer Server Settings' window. At the top, there are input fields for 'Analyzer Server ID (1-4)', 'Owner Name', 'Timeout (1-2000000)', 'Collector (IPv6) Address', 'Collector Port (1-65535)', and 'Max Datagram Size (300-1400)'. A checkbox for 'Infinite' is also present. Below these fields is a table titled 'Total Entries: 1' with one row containing values for Server ID, Owner, Timeout, CCT, Collector Address, Collector Port, and Max Datagram Size. Buttons for 'Edit' and 'Delete' are located next to the table. A note at the bottom states: 'Note: CCT means Current Countdown Time.'

Server ID	Owner	Timeout	CCT	Collector Address	Collector Port	Max Datagram Size
1	ONa...	400	400	0.0.0.0	6343	1400

Figure 11-21 sFlow Analyzer Server Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Analyzer Server ID (1-4)</b>	The analyzer server ID specifies the ID of a server analyzer where the packet will be forwarded.
<b>Owner Name</b>	The entity making use of this sFlow analyzer server. When owner is set or modified, the timeout value will become 400 automatically.
<b>Timeout (1-2000000)</b>	The length of time before the server times out. When the analyzer server times out, all of the flow samplers and counter pollers associated with this analyzer server will be deleted. If not specified, its default value is 400. Tick the <b>Infinite</b> check box to have unlimited time.
<b>Collector (IPv6) Address</b>	The IP address of the analyzer server. If not specified or set a 0 address, the entry will be inactive.
<b>Collector Port (1-65535)</b>	The destination UDP port for sending the sFlow datagrams. If not specified, the default value is 6343.

<b>Max Datagram Size (300-1400)</b>	The maximum number of data bytes that can be packed in a single sample datagram. If not specified, the default value is 1400.
-------------------------------------	---

Click the **Apply** button to accept the changes made.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## sFlow Flow Sampler Settings

On this page the user can configure the sFlow flow sampler parameters. By configuring the sampling function for a port, a sample packet received by this port will be encapsulated and forwarded to the analyzer server at the specified interval.

To view this window, click **Monitoring > sFlow > sFlow Flow Sampler Settings** as shown below:

**NOTE:** If the user wants to change the analyze server ID, he needs to delete the flow sampler and creates a new one.

sFlow Flow Sampler Settings						
Unit	From Port	To Port	Analyzer Server ID (1-4)	RX Rate (0-65535)	TX Rate (0-65535)	Max Header Size (18-256)
1	01	01				
<input type="button" value="Apply"/> <input type="button" value="Delete All"/>						
<b>Total Entries: 0</b>						
Port	Server ID	Configuration RX Rate	Configuration TX Rate	Active RX Rate	Active TX Rate	Max Header Size

Figure 11-22 sFlow Flow Sampler Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menus to specify the list of ports to be configured.
<b>Analyzer Server ID</b>	The analyzer server ID specifies the ID of a server analyzer where the packet will be forwarded.
<b>Rate</b>	<p>The sampling rate for packet <b>Rx</b> sampling. The configured rate value multiplied by 256 is the actual rate. For example, if the rate is 20, the actual rate 5120. One packet will be sampled from every 5120 packets. If set to 0, the sampler is disabled. If the rate is not specified, its default value is 0.</p> <p>The sampling rate for packet <b>Tx</b> sampling. The configured rate value multiplied by 256 is the actual rate. For example, if the rate is 20, the actual rate 5120. One packet will be sampled from every 5120 packets. If set to 0, the sampler is disabled. If the rate is not specified, its default value is 0.</p>
<b>MAX Header Size</b>	The maximum number of leading bytes in the packet which has been sampled that will be encapsulated and forwarded to the server. If not specified, the default value is 128.

Click the **Apply** button to accept the changes made.

Click the **Delete All** button to remove all the entries listed.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## sFlow Counter Poller Settings

On this page the user can configure the sFlow counter poller parameters. If the user wants to change the analyzer server ID, he needs to delete the counter poller and create a new one.

To view this window, click **Monitoring > sFlow > sFlow Counter Poller Settings** as shown below:

sFlow Counter Poller Settings				Safeguard	
Unit	From Port	To Port	Analyzer Server ID (1-4)	Interval (20-120)	<input type="checkbox"/> Disabled
1	01	01			<b>Apply</b>
<b>Delete All</b>					
<b>Total Entries: 0</b>					
Port	Analyzer Server ID	Polling Interval (sec)			

Figure 11-23 sFlow Counter Poller Settings

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Select the unit you wish to configure.
<b>From Port / To Port</b>	Use the drop-down menus to specify the list of ports to be configured.
<b>Analyzer Server ID</b>	The analyzer server ID specifies the ID of a server analyzer where the packet will be forwarded.
<b>Interval</b>	The maximum number of seconds between successive samples of the counters.

Click the **Apply** button to accept the changes made.

Click the **Delete All** button to remove all the entries listed.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

## Ping

### Broadcast Ping Relay Settings

This window is used to enable or disable broadcast ping reply state, device will reply broadcast ping request.

To view this window, click **Monitoring > Ping > Broadcast Ping Relay Settings** as shown below:

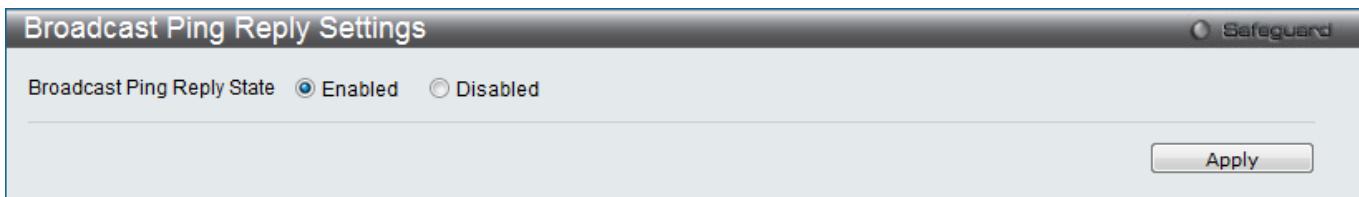

Figure 11-24 Broadcast Ping Relay Settings window

The fields that can be configured are described below:

Parameter	Description
<b>Broadcast Ping Relay State</b>	Click the radio buttons to enable or disable broadcast ping relay state.

Click the **Apply** button to accept the changes made.

## Ping Test

Ping is a small program that sends ICMP Echo packets to the IP address you specify. The destination node then responds to or “echoes” the packets sent from the Switch. This is very useful to verify connectivity between the Switch and other nodes on the network.

To view this window, click **Monitoring > Ping > Ping Test** as shown below:

The screenshot shows the "Ping Test" configuration window. It has two main sections: "IPv4 Ping Test" and "IPv6 Ping Test".

**IPv4 Ping Test:**  
 Enter the IPv4 address of the device or station you want to ping, then click **Start**.  
 Target IPv4 Address:   
 Domain Name:   
 Repeat Pinging for:  Infinite times  
  (1-255 times)  
 Timeout:  1 (1-99 sec)  
 Source IPv4 Address:   
 Start

**IPv6 Ping Test:**  
 Enter the IPv6 address of the device or station you want to ping, then click **Start**.  
 Target IPv6 Address:   
 Interface Name:   
 Repeat Pinging for:  Infinite times  
  (1-255 times)  
 Size:  100 (1-6000)  
 Timeout:  1 (1-99 sec)  
 Source IPv6 Address:   
 Start

Figure 11-25 Ping Test window

The user may click the Infinite times radio button, in the Repeat Pinging for field, which will tell the ping program to keep sending ICMP Echo packets to the specified IP address until the program is stopped. The user may opt to choose a specific number of times to ping the Target IP Address by clicking its radio button and entering a number between 1 and 255.

The fields that can be configured are described below:

Parameter	Description
<b>Target IP Address</b>	Click the radio button and enter an IP address to be pinged.
<b>Domain Name</b>	Click the radio button and enter the domain name of the host.
<b>Repeat Pinging for</b>	Enter the number of times desired to attempt to Ping either the IPv4 address or the IPv6 address configured in this window. Users may enter a number of times between 1 and 255.
<b>Size</b>	For IPv6 only, enter a value between 1 and 6000. The default is 100.
<b>Timeout</b>	Select a timeout period between 1 and 99 seconds for this Ping message to reach its destination. If the packet fails to find the IP address in this specified time, the Ping packet will be dropped.
<b>Source IP</b>	the source IP/IPv6 address of the ping packets. If specifies source IP/IPv6 address, the IP/IPv6 address will be used as the packets' source IP address that ping send to remote host.

Click the **Start** button to initiate the Ping Test.

After clicking the **Start** button, the following page will appear:

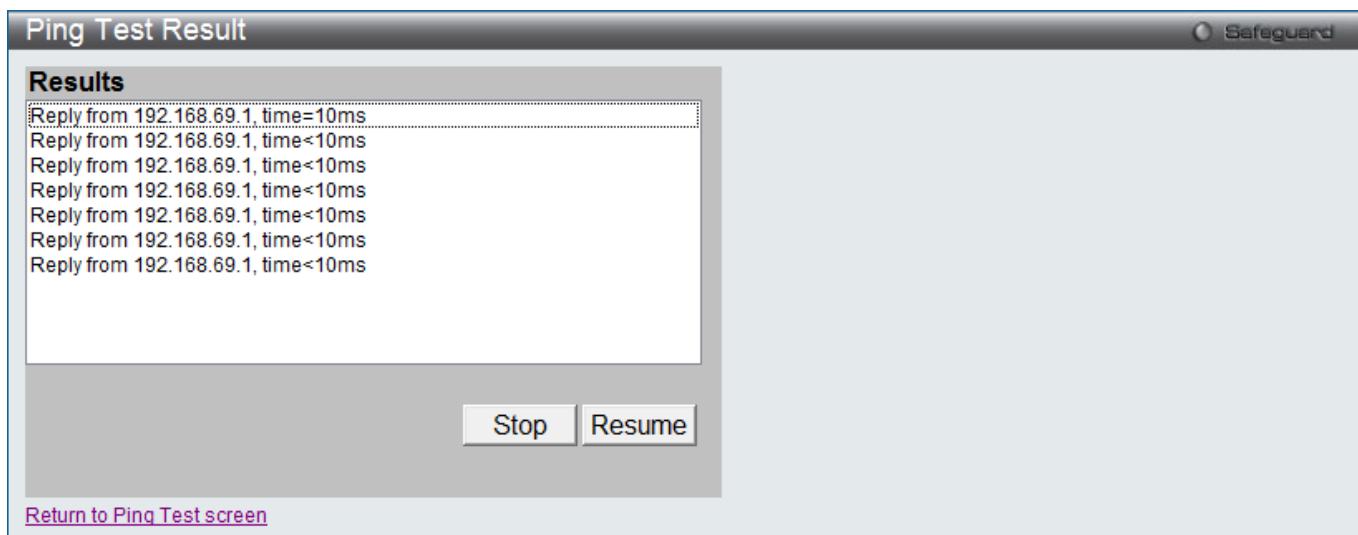

Figure 11-26 Ping Test Result window

Click the **Stop** button to halt the Ping Test.

Click the **Resume** button to resume the Ping Test.

## Trace Route

The trace route page allows the user to trace a route between the switch and a given host on the network.

To view this window, click **Monitoring > Trace Route** as shown below:

The screenshot shows the 'Trace Route' window with two main sections: 'IPv4 Trace Route' and 'IPv6 Trace Route'.  
**IPv4 Trace Route:**  
 - IP Address: 0.0.0.0  
 - Domain Name: (Max: 255 characters)  
 - TTL (1-60): 30  
 - Port (30000-64900): 33435  
 - Timeout (1-65535): 5 sec  
 - Probe (1-9): 1  
 - Start button  
**IPv6 Trace Route:**  
 - IPv6 Address: (empty)  
 - TTL (1-60): 30  
 - Port (30000-64900): 33435  
 - Timeout (1-65535): 5 sec  
 - Probe (1-9): 1  
 - Start button

Figure 11-27 Trace Route window

The fields that can be configured are described below:

Parameter	Description
<b>IPv4 Address / IPv6 Address</b>	IP address of the destination station.
<b>Domain Name</b>	The domain name of the destination end station.
<b>TTL (1-60)</b>	The time to live value of the trace route request. This is the maximum number of routers that a trace route packet can pass. The trace route option will cross while seeking the network path between two devices. The range for the TTL is 1 to 60 hops.
<b>Port (30000-64900)</b>	The port number. The value range is from 30000 to 64900.
<b>Timeout (1-65535)</b>	Defines the timeout period while waiting for a response from the remote device. A value of 1 to 65535 seconds can be specified. The default is 5 seconds.
<b>Probe (1-9)</b>	The number of probing. The range is from 1 to 9. If unspecified, the default value is 1.

Click the **Start** button to initiate the Trace Route.

After clicking the **Start** button, the following page will appear:

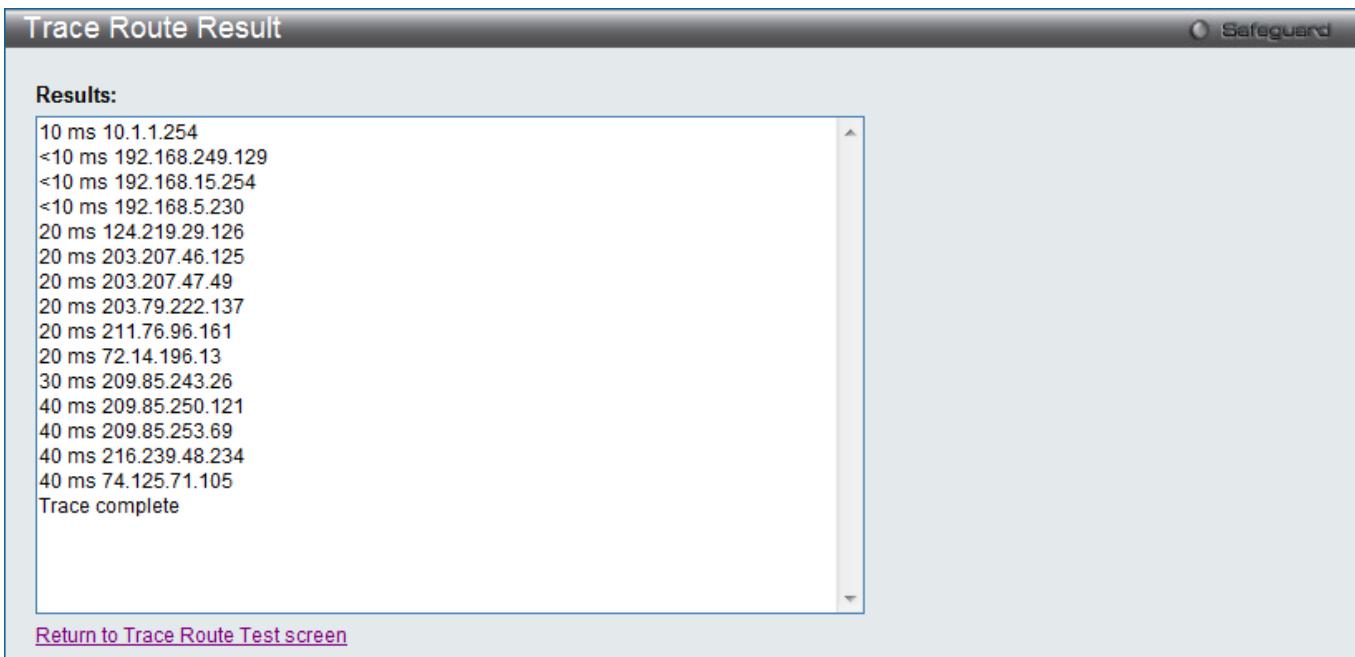

Figure 11-28 Trace Route Result window

## Peripheral

### Device Environment

The device environment feature displays the Switch internal temperature status.

To view this window, click **Monitoring > Peripheral > Device Environment** as shown below:

Device Environment		Safeguard
		Refresh
Items	Data	
High Warning Temperature Threshold (celsius)	79	
Low Warning Temperature Threshold (celsius)	11	
<b>Unit</b>	<b>1</b>	
Internal Power	Active	
External Power	Fail	
Right Fan 1	Speed Low (3000 RPM)	
Right Fan 2	Speed Low (3000 RPM)	
Current Temperature(celsius)	28	
Fan High Temperature Threshold (celsius)	40	
Fan Low Temperature Threshold (celsius)	35	

Figure 11-29 Device Environment window

Click the **Refresh** button to refresh the display table.

## External Alarm Settings

On this page, the user can configure the external alarm message for a channel.

The source for the alarm is located on the front panel of the Switch. They are monitored via the pre-defined connection channels, with each channel representing a specific alarm event. This page also allows the user to define the alarm event associated with each channel.

To view this window, click **Monitoring > Peripheral > External Alarm Settings** as shown below:

External Alarm Settings				Safeguard
Unit	Channel	Status	Message	
1	1	Normal	External Alarm 1	Edit
1	2	Normal	External Alarm 2	Edit

Figure 11-30 External Alarm Settings window

The fields that can be configured are described below:

Parameter	Description
Unit	Specifies the unit ID to be displayed.

Click the **Refresh** button to refresh the display table.

Click the **Edit** button to re-configure the *Message* option for a specific entry.

# Chapter 12 Save and Tools

**Save Configuration / Log**

**Stacking Information**

**Download Firmware**

**Upload Firmware**

**Download Configuration**

**Upload Configuration**

**Upload Log File**

**Reset**

**Reboot System**

## Save Configuration / Log

To view this window, click **Save > Save Configuration / Log**, as shown below.

Save Configuration allows the user to backup the configuration of the switch to a folder on the computer. Select **Configuration** from the **Type** drop-down menu and enter the **File Path** in the space provided and click **Apply**.

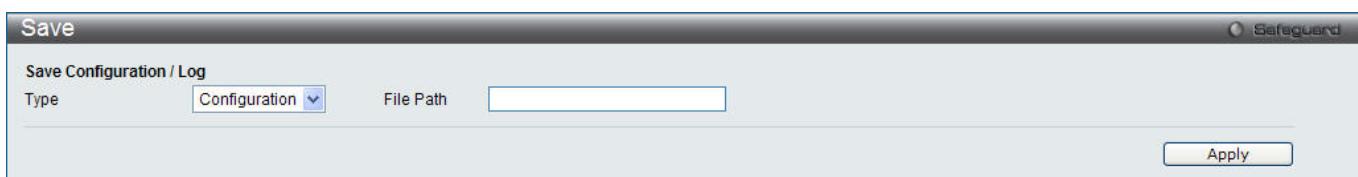

Figure 12-1 Save – Configuration window

**Save Log** allows the user to backup the log file of the switch. Select **Log** from the **Type** drop-down menu and click **Apply**.

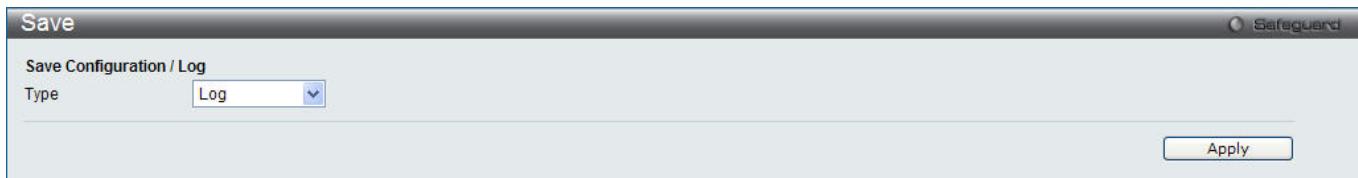

Figure 12-2 Save – Log window

**Save All** allows the user to permanently save changes made to the configuration. This option will allow the changes to be kept after the switch has rebooted. Select **All** from the **Type** drop-down menu and click **Apply**.

Figure 12-3 Save – All window

## Stacking Information

To change a switch's default stacking configuration (for example, the order in the stack), see **System Configuration > Stacking > Stacking Mode Settings** window.

The number of switches in the switch stack (up to 12 total) are displayed next to the Tools drop-down menu. The icons are in the same order as their respective Unit numbers, with the Unit 1 switch corresponding to the icon in the upper left-most corner of the icon group.

When the switches are properly interconnected through their optional Stacking Modules, information about the resulting switch stack is displayed under the **Stacking Information** link.

To view this window, click **Tools > Stacking Information**, as shown below.

Stacking Information									Safeguard
Topology		Duplex Chain							
My Box ID		1							
Master ID		1							
Box Count		1							
Force Master Role		Disabled							
Stacking Trap State		Enabled							
Stacking Log State		Enabled							
Box ID	User Set	Type	Exist	Priority	MAC	Prom Version	Runtime Version	HW Version	
1	Auto	DGS-3420-28SC	Exist	32	00-01-02-03-04-00	1.00.003	1.50.010	B1	
2	-	NOT_EXIST	No						
3	-	NOT_EXIST	No						
4	-	NOT_EXIST	No						
5	-	NOT_EXIST	No						
6	-	NOT_EXIST	No						
7	-	NOT_EXIST	No						
8	-	NOT_EXIST	No						
9	-	NOT_EXIST	No						
10	-	NOT_EXIST	No						
11	-	NOT_EXIST	No						
12	-	NOT_EXIST	No						

Figure 12-4 Stacking Information window

The Stacking Information window displays the following information:

Parameter	Description
<b>Topology</b>	Show the current topology employed using this Switch.
<b>My Box ID</b>	Display the Box ID of the Switch currently in use.
<b>Master ID</b>	Display the Unit ID number of the Primary Master of the Switch stack.
<b>Box Count</b>	Display the number of switches in the switch stack.
<b>Force Master Role</b>	Display force master role state
<b>Box ID</b>	Display the Switch's order in the stack.
<b>User Set</b>	Box ID can be assigned automatically (Auto), or can be assigned statically. The default is Auto.
<b>Type</b>	Display the model name of the corresponding switch in a stack.
<b>Exist</b>	Denote whether a switch does or does not exist in a stack.
<b>Priority</b>	Display the priority ID of the Switch. The lower the number, the higher the priority. The box (switch) with the lowest priority number in the stack denotes the Primary Master switch.
<b>MAC</b>	Display the MAC address of the corresponding switch in the switch stack.
<b>Prom Version</b>	Show the PROM in use for the Switch. This may be different from the values shown in the illustration.

<b>Runtime Version</b>	Show the firmware version in use for the Switch. This may be different from the values shown in the illustrations.
<b>H/W Version</b>	Show the hardware version in use for the Switch. This may be different from the values shown in the illustration.

## Download Firmware

The following window is used to download firmware for the Switch.

### Download Firmware from TFTP

This window allows the user to download firmware from a TFTP Server to the Switch and updates the switch.

**Download Firmware From TFTP**

**Unit**: All

**TFTP Server IP**:  (IPv4)   
 (IPv6)   
 (Domain Name)

**Source File**:

**Destination File**:

**Boot Up**:

**Download**

---

**TFTP Source IP Settings**

**Interface Name**:  (Max: 12 characters)

**IPv4 Address**:

**IPv6 Address**:

**Apply** **Clear IP Address**

Figure 12-5 Download Firmware from TFTP window

In the **Download Firmware From TFTP** section, the fields that can be configured are described below:

Parameter	Description	
<b>Unit</b>	Use the drop-down menu to select a unit for receiving the firmware. Select <b>All</b> for all units.	
<b>TFTP Server IP</b>	Enter the TFTP server IP address used.	
	<b>IPv4</b>	Click the radio button to enter the TFTP server IP address used.
	<b>IPv6</b>	Click the radio button to enter the TFTP server IPv6 address used.
	<b>Domain Name</b>	Click the radio button to enter the domain name.
<b>Source File</b>	Enter the location and name of the Source File.	
<b>Destination File</b>	Enter the location and name of the Destination File.	
<b>Boot Up</b>	Tick the check box to set it as a boot up file.	

Click **Download** to initiate the download.

In the **TFTP Source IP Settings** section, the fields that can be configured are described below:

Parameter	Description
<b>Interface Name</b>	Enter the source interface name used here.
<b>IPv4 Address</b>	Enter the source IPv4 address used here.
<b>IPv6 Address</b>	Enter the source IPv6 address used here.

Click the **Apply** button to accept the changes made.

Click the **Clear IP Address** button to clear the IP addresses linked to the source IP interface.

## Download Firmware from RCP

This window allows the user to download firmware from a RCP Server to the Switch and updates the switch.

Download Firmware from RCP	
Unit	All
RCP Server IP	<input type="text"/>
User Name	<input type="text"/>
Source File	<input type="text"/>
Destination File	<input type="text"/>
Boot Up	<input type="checkbox"/>
<b>Download</b>	

Figure 12-6 Download Firmware from RCP window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Use the drop-down menu to select a unit for receiving the firmware. Select <b>All</b> for all units.
<b>RCP Server IP</b>	Enter the RCP server IP address used.
<b>Source File</b>	Enter the location and name of the Source File.
<b>User Name</b>	Enter the remote user name on the RCP server.
<b>Destination File</b>	Enter the location and name of the Destination File.
<b>Boot Up</b>	Tick the check box to set it as a boot up file.

Click **Download** to initiate the download.

## Download Firmware from HTTP

This window allows the user to download firmware from a computer to the Switch and updates the switch.

Download Firmware from HTTP	
Unit	All
Source File	<input type="text"/> <b>Browse...</b>
Destination File	<input type="text"/>
Boot Up	<input type="checkbox"/>
<b>Download</b>	

**Figure 12-7 Download Firmware from HTTP window**

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Use the drop-down menu to select a unit for receiving the firmware. Select <b>All</b> for all units.
<b>Source File</b>	Enter the location and name of the Source File or click the <b>Browse</b> button to navigate to the firmware file for the download.
<b>Destination File</b>	Enter the location and name of the Destination File.
<b>Boot Up</b>	Tick the check box to set it as a boot up file.

Click **Download** to initiate the download.

## Upload Firmware

The following window is used to upload firmware from the Switch.

### Upload Firmware to TFTP

This window allows the user to upload firmware from the Switch to a TFTP Server.

<b>Upload Firmware to TFTP</b>	
Unit	1
TFTP Server IP	<input type="radio"/> IPv4 <input type="radio"/> IPv6 <input type="radio"/> Domain Name
Source File	<input type="text"/>
Destination File	<input type="text"/>
<b>Upload</b>	

**Figure 12-8 Upload Firmware to TFTP window**

The fields that can be configured are described below:

Parameter	Description	
<b>Unit</b>	Use the drop-down menu to select a unit for uploading the firmware.	
<b>TFTP Server IP</b>	Enter the TFTP server IP address used.	
	<b>IPv4</b>	Click the radio button to enter the TFTP server IP address used.
	<b>IPv6</b>	Click the radio button to enter the TFTP server IPv6 address used.
	<b>Domain Name</b>	Click the radio button to enter the domain name.
<b>Destination File</b>	Enter the location and name of the Destination File.	
<b>Source File</b>	Enter the location and name of the Source File.	

Click **Upload** to initiate the upload.

## Upload Firmware to RCP

This window allows the user to upload firmware from the Switch to a RCP Server.

Upload Firmware to RCP	
Unit	1
RCP Server IP	<input type="text"/>
User Name	<input type="text"/>
Source File	<input type="text"/>
Destination File	<input type="text"/>

Parameter	Description
<b>Unit</b>	Use the drop-down menu to select a unit for uploading the firmware.
<b>Source File</b>	Enter the location and name of the Source File.

Click **Upload** to initiate the upload.

## Download Configuration

The following window is used to download the configuration file for the Switch.

## Download Configuration from TFTP

This window allows the user to download the configuration file from a TFTP Server to the Switch and updates the switch.

The screenshot shows the 'Download Configuration File from TFTP' window. At the top right is a 'Safeguard' icon. The 'Unit' field has a dropdown menu set to 'All'. The 'TFTP Server IP' field has three options: 'IPv4' (selected), 'IPv6', and 'Domain Name'. Below these are fields for 'Source File' and 'Destination File'. A 'Increment' checkbox is present. At the bottom right is a 'Download' button.

**Figure 12-11 Download Configuration File from TFTP window**

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Use the drop-down menu to select a unit for receiving the configuration file. Select <b>All</b> for all units.
<b>TFTP Server IP</b>	Enter the TFTP server IP address used.
	<b>IPv4</b> Click the radio button to enter the TFTP server IP address used.
	<b>IPv6</b> Click the radio button to enter the TFTP server IPv6 address used.
	<b>Domain Name</b> Click the radio button to enter the domain name.
<b>Source File</b>	Enter the location and name of the Source File.
<b>Destination File</b>	Enter the location and name of the Destination File.
<b>Increment</b>	Tick the check box to keep the existing configuration before applying to the new configuration. Deselect the check box to clear the existing configuration before applying to the new configuration.

Click **Download** to initiate the download.

## Download Configuration from RCP

This window allows the user to download the configuration file from a RCP Server to the Switch and updates the switch.

The screenshot shows the 'Download Configuration File from RCP' window. At the top right is a 'Safeguard' icon. The 'Unit' field has a dropdown menu set to 'All'. The 'RCP Server IP' field is empty. Below these are fields for 'User Name', 'Source File', and 'Destination File'. At the bottom right is a 'Download' button.

**Figure 12-12 Download Configuration from RCP window**

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Use the drop-down menu to select a unit for receiving the configuration file. Select <b>All</b> for all units.
<b>RCP Server IP</b>	Enter the RCP Server IP Address used.
<b>User Name</b>	Enter the appropriate Username used.
<b>Source File</b>	Enter the location and name of the Source File.
<b>Destination File</b>	Enter the location and name of the Destination File.

Click **Download** to initiate the download.

## Download Configuration from HTTP

This window allows the user to download the configuration file from a computer to the Switch and updates the switch.

The screenshot shows a software interface titled "Download Configuration File from HTTP". It includes the following fields:

- Unit:** A dropdown menu set to "All".
- Source File:** An input field with a "Browse..." button.
- Destination File:** An input field with a "Browse..." button.
- Increment:** A checkbox.
- Download:** A large grey button at the bottom right.

Figure 12-13 Download Configuration File from HTTP window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Use the drop-down menu to select a unit for receiving the configuration file. Select <b>All</b> for all units.
<b>Source File</b>	Enter the location and name of the Source File, or click the <b>Browse</b> button to navigate to the configuration file for the download.
<b>Destination File</b>	Enter the location and name of the Destination File.
<b>Increment</b>	Tick the check box to keep the existing configuration before applying to the new configuration. Deselect the check box to clear the existing configuration before applying to the new configuration.

Click **Download** to initiate the download.

## Upload Configuration

The following window is used to upload the configuration file from the Switch.

## Upload Configuration to TFTP

This window allows the user to upload the configuration file from the Switch to a TFTP Server.

Unit: 1

TFTP Server IP:  (radio buttons: IPv4 , IPv6 , Domain Name

Source File:

Destination File:

Filter: Include  (e.g.: SNMP, VLAN, STP)

Filter: Include  (e.g.: SNMP, VLAN, STP)

Filter: Include  (e.g.: SNMP, VLAN, STP)

Figure 12-14 Upload Configuration File to TFTP window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Use the drop-down menu to select a unit for uploading the configuration file.
<b>TFTP Server IP</b>	Enter the TFTP server IP address used.
	<b>IPv4</b> Click the radio button to enter the TFTP server IP address used.
	<b>IPv6</b> Click the radio button to enter the TFTP server IPv6 address used.
	<b>Domain Name</b> Click the radio button to enter the domain name.
<b>Source File</b>	Enter the location and name of the Source File.
<b>Destination File</b>	Enter the location and name of the Destination File.
<b>Filter</b>	Use the drop-down menu to <i>Include</i> , <i>Exclude</i> or <i>Begin</i> a filter like SNMP, VLAN or STP. Select the appropriate <b>Filter</b> action and enter the service name in the space provided.

Click **Upload** to initiate the upload.

## Upload Configuration to RCP

This window allows the user to upload the configuration file from the Switch to a RCP Server.

Unit: 1

RCP Server IP:

User Name:

Source File:

Destination File:

Filter: Include  (e.g.: SNMP, VLAN, STP)

Filter: Include  (e.g.: SNMP, VLAN, STP)

Filter: Include  (e.g.: SNMP, VLAN, STP)

Figure 12-15 Upload Configuration to RCP window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Use the drop-down menu to select a unit for uploading the configuration file.
<b>RCP Server IP</b>	Enter the RCP Server IP Address used.
<b>User Name</b>	Enter the appropriate Username used.
<b>Source File</b>	Enter the location and name of the Source File.
<b>Destination File</b>	Enter the location and name of the Destination File.
<b>Filter</b>	Use the drop-down menu to <i>Include</i> , <i>Exclude</i> or <i>Begin</i> a filter like SNMP, VLAN or STP. Select the appropriate <b>Filter</b> action and enter the service name in the space provided.

Click **Upload** to initiate the upload.

## Upload Configuration to HTTP

This window allows the user to upload the configuration file from the Switch to a computer.

Figure 12-16 Upload Configuration File to HTTP window

The fields that can be configured are described below:

Parameter	Description
<b>Unit</b>	Use the drop-down menu to select a unit for uploading the configuration file.
<b>Source File</b>	Enter the location and name of the Source File.
<b>Filter</b>	Use the drop-down menu to <i>Include</i> , <i>Exclude</i> or <i>Begin</i> a filter like SNMP, VLAN or STP. Select the appropriate <b>Filter</b> action and enter the service name in the space provided.

Click **Upload** to initiate the upload.

## Upload Log File

The following window is used to upload the log file from the Switch.

## Upload Log to TFTP

This window allows the user to upload the log file from the Switch to a TFTP Server.

The screenshot shows the 'Upload Log to TFTP' window. It includes fields for 'TFTP Server IP' (with options for IPv4, IPv6, or Domain Name), 'Destination File', 'Log Type' (with options for Common Log or Attack Log), and an 'Upload' button.

Figure 12-17 Upload Log – TFTP window

The fields that can be configured are described below:

Parameter	Description	
<b>TFTP Server IP</b>	Enter the TFTP server IP address used.	
	<b>IPv4</b>	Click the radio button to enter the TFTP server IP address used.
	<b>IPv6</b>	Click the radio button to enter the TFTP server IPv6 address used.
	<b>Domain Name</b>	Click the radio button to enter the domain name.
<b>Destination File</b>	Enter the location and name of the Destination File.	
<b>Log Type</b>	Select the type of log to be transferred. Selecting the <b>Common Log</b> option here will upload the common log entries. Selecting the <b>Attack Log</b> option here will upload the log concerning attacks.	

Click **Upload** to initiate the upload.

## Upload Log to RCP

This window allows the user to upload the log file from the Switch to a RCP Server.

The screenshot shows the 'Upload Log to RCP' window. It includes fields for 'RCP Server IP', 'User Name', 'Destination File', 'Log Type' (with options for Common Log or Attack Log), and an 'Upload' button.

Figure 12-18 Upload Log to RCP window

The fields that can be configured are described below:

Parameter	Description	
<b>RCP Server IP</b>	Enter the RCP Server IP Address used.	
<b>User Name</b>	Enter the appropriate Username used.	
<b>Destination File</b>	Enter the location and name of the Destination File.	
<b>Log Type</b>	Select the type of log to be transferred. Selecting the <b>Common Log</b> option here will upload the common log entries. Selecting the <b>Attack Log</b> option here will upload the log concerning attacks.	

Click **Upload** to initiate the upload.

## Upload Log to HTTP

This window allows the user to upload the log file from the Switch to a computer.

Figure 12-19 Upload Log to HTTP window

The fields that can be configured are described below:

Parameter	Description
<b>Log Type</b>	Select the type of log to be transferred. Selecting the <b>Common Log</b> option here will upload the common log entries. Selecting the <b>Attack Log</b> option here will upload the log concerning attacks.

Click **Upload** to initiate the upload.

## Reset

The Reset function has several options when resetting the Switch. Some of the current configuration parameters can be retained while resetting all other configuration parameters to their factory defaults.

**NOTE:** Only the Reset System option will enter the factory default parameters into the Switch's non-volatile RAM, and then restart the Switch. All other options enter the factory defaults into the current configuration, but do not save this configuration. Reset System will return the Switch's configuration to the state it was when it left the factory

Reset gives the option of retaining the Switch's User Accounts and History Log while resetting all other configuration parameters to their factory defaults. If the Switch is reset using this window, and **Save Changes** is not executed, the Switch will return to the last saved configuration when rebooted.

Figure 12-20 Reset System window

The fields that can be configured are described below:

Parameter	Description
<b>Reset</b>	Selecting this option will factory reset the Switch but not the <i>IP Address</i> , <i>User Accounts</i> and the <i>Banner</i> .
<b>Reset Config</b>	Selecting this option will factory reset the Switch but not perform a Reboot.
<b>Reset System</b>	Selecting this option will factory reset the Switch and perform a Reboot.

Click the **Apply** button to initiate the Reset action.

## Reboot System

The following window is used to restart the Switch.

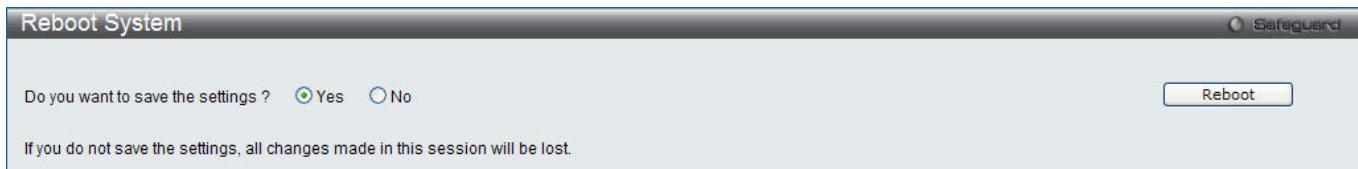

Figure 12-21 Reboot System Window

Selecting the **Yes** radio button will instruct the Switch to save the current configuration to non-volatile RAM before restarting the Switch.

Selecting the **No** radio button instructs the Switch not to save the current configuration before restarting the Switch. All of the configuration information entered from the last time **Save Changes** was executed will be lost.

Click the **Reboot** button to restart the Switch.

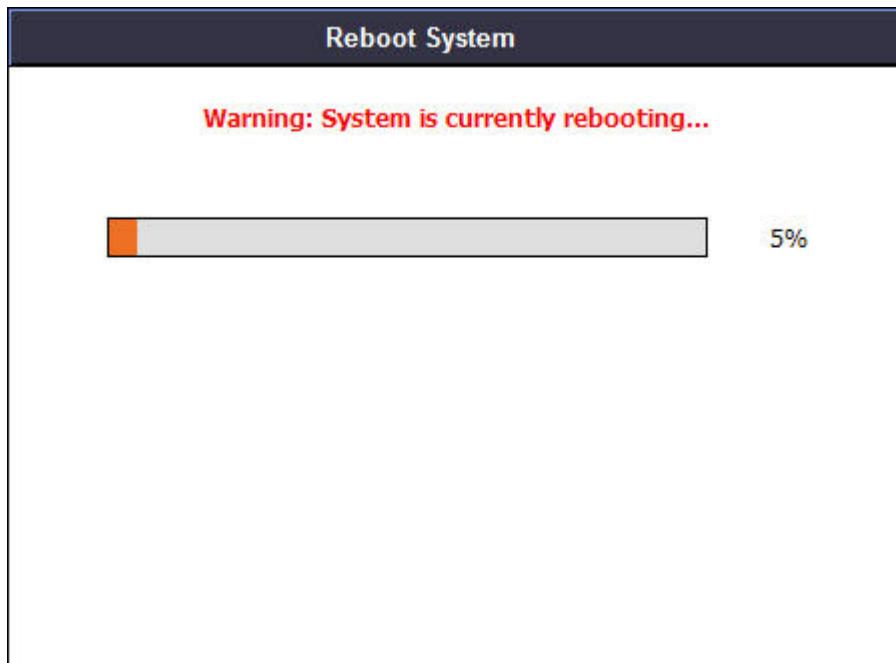

Figure 12-22 System Rebooting window

# Appendix A - Password Recovery Procedure

This document describes the procedure for resetting passwords on D-Link Switches.

Authenticating any user who tries to access networks is necessary and important. The basic authentication method used to accept qualified users is through a local login, utilizing a Username and Password. Sometimes, passwords get forgotten or destroyed, so network administrators need to reset these passwords. This document will explain how the Password Recovery feature can help network administrators reach this goal.

The following steps explain how to use the Password Recovery feature on D-Link devices to easily recover passwords.

## **Complete these steps to reset the password:**

1. For security reasons, the Password Recovery feature requires the user to physically access the device. Therefore this feature is only applicable when there is a direct connection to the console port of the device. It is necessary for the user needs to attach a terminal or PC with terminal emulation to the console port of the switch.
2. Power on the Switch. After the UART init is loaded to 100%, the Switch will allow 2 seconds for the user to press the hotkey [^] (Shift + 6) to enter the “Password Recovery Mode.” Once the Switch enters the “Password Recovery Mode,” all ports on the Switch will be disabled.

Boot Procedure	V1.00.003
<hr/>	
Power On Self Test .....	100 %
MAC Address : 00-01-02-03-04-00	
H/W Version : B1	
Please Wait, Loading V1.50.010 Runtime Image .....	100 %
UART init .....	100 %

Password Recovery Mode
>

1. In the “Password Recovery Mode” only the following commands can be used.

Command	Parameters
<b>reset config {force_agree}</b>	The <b>reset config</b> command resets the whole configuration back to the default values. The option ' <b>force_agree</b> ' means to reset the whole configuration without the user's agreement.
<b>reboot {force_agree}</b>	The <b>reboot</b> command exits the Reset Password Recovery Mode and restarts the switch. A confirmation message will be displayed to allow the user to save the current settings. The option ' <b>force_agree</b> ' means to reset the whole configuration without the user's agreement.
<b>reset account</b>	The <b>reset account</b> command deletes all the previously created accounts.
<b>reset password {&lt;username&gt;}</b>	The <b>reset password</b> command resets the password of the specified user. If a username is not specified, the passwords of all users will be reset.
<b>show account</b>	The <b>show account</b> command displays all previously created accounts.

## Appendix B - System Log Entries

The following table lists all possible entries and their corresponding meanings that will appear in the System Log of this Switch.

Category	Log Description	Severity	Note
<b>MAC-based Access Control</b>	<p>Event description: A host failed to pass the authentication  Log Message: MAC-based Access Control unauthenticated host (MAC: &lt;macaddr&gt;, Port &lt;[unitID:]portNum&gt;, VID: &lt;vid&gt;)</p> <p>Parameters description:  macaddr: MAC address  unitID: The unit ID.  portNum: The port number.  vid: VLAN ID on which the host exists</p>	Critical	
	<p>Event description: The authorized user number on a port has reached the maximum user limit.  Log Message: Port &lt;[unitID:]portNum&gt; enters MAC-based Access Control stop learning state.</p> <p>Parameters description:  unitID: The unit ID.  portNum: The port number.</p>	Warning	
	<p>Event description: The authorized user number on a port is below the maximum user limit in a time interval (interval is project dependent).  Log Message: Port &lt;[unitID:]portNum&gt; recovers from MAC-based Access Control stop learning state.</p> <p>Parameters description:  unitID: The unit ID.  portNum: The port number.</p>	Warning	
	<p>Event description: The authorized user number on the whole device has reached the maximum user limit.  Log Message: MAC-based Access Control enters stop learning state.</p> <p>Parameters description:  None</p>	Warning	
	<p>Event description: The authorized user number on the whole device is below the maximum user limit in a time interval (interval is project dependent).  Log Message: MAC-based Access Control recovers from stop learning state.</p> <p>Parameters description:  None</p>	Warning	
	<p>Event description: A host has passed the authentication.  Log Message: MAC-based Access Control host login successful (MAC: &lt;macaddr&gt;, port: &lt;[unitID]portNum&gt;, VID: &lt;vid&gt;)</p> <p>Parameters description:  macaddr: The MAC address.  unitID: The unit ID.  portNum: The port number.</p>	Informational	

	vid: The VLAN ID on which the host exists.		
	<p>Event description: A host has aged out.  Log Message: MAC-based Access Control host aged out (MAC: &lt;macaddr&gt;, port: &lt;[unitID]portNum&gt;, VID: &lt;vid&gt;)</p> <p>Parameters description:  macaddr: The MAC address  unitID: The unit ID.  portNum: The port number.  vid: The VLAN ID on which the host exists.</p>	Informational	
PTP	<p>Event description: PTP port role changed  Log Message: PTP port &lt;[unitID:]portNum&gt; role changed to &lt;ptp_role&gt;.</p> <p>Parameters description:  unitID: The unit ID.  portNum: The port number.  ptp_role: The PTP role of the port.</p>	Informational	
	<p>Event description: PTP clock synchronized  Log Message: The boundary clock synchronized to its master, the offset value is &lt;+ -&gt;&lt;Offset&gt; second(s).</p> <p>Parameters description:  Offset: The value of the offset between the slave and master.</p>	Informational	Only when the synchronized more than one second, this log message will be send.
DHCPv6 Client	<p>Event description: DHCPv6 client interface administrator state changed.  Log Message: DHCPv6 client on interface &lt;ipif-name&gt; changed state to [enabled   disabled].</p> <p>Parameters description:  &lt;ipif-name&gt;: Name of the DHCPv6 client interface.</p>	Informational	
	<p>Event description: DHCPv6 client obtains an ipv6 address from a DHCPv6 server.  Log Message: DHCPv6 client obtains an ipv6 address &lt; ipv6address &gt; on interface &lt;ipif-name&gt;.</p> <p>Parameters description:  ipv6address: ipv6 address obtained from a DHCPv6 server.  ipif-name: Name of the DHCPv6 client interface.</p>	Informational	
	<p>Event description: The ipv6 address obtained from a DHCPv6 server starts renewing.  Log Message: The IPv6 address &lt; ipv6address &gt; on interface &lt;ipif-name&gt; starts renewing.</p> <p>Parameters description:  ipv6address: ipv6 address obtained from a DHCPv6 server.  ipif-name: Name of the DHCPv6 client interface.</p>	Informational	
	<p>Event description: The ipv6 address obtained from a DHCPv6 server renews success.  Log Message: The IPv6 address &lt; ipv6address &gt; on interface &lt;ipif-name&gt; renews success.</p> <p>Parameters description:  ipv6address: ipv6 address obtained from a DHCPv6 server.</p>	Informational	

	ipif-name: Name of the DHCPv6 client interface.		
	<p>Event description: The ipv6 address obtained from a DHCPv6 server starts rebinding  Log Message: The IPv6 address &lt; ipv6address &gt; on interface &lt;ipif-name&gt; starts rebinding.</p> <p>Parameters description:  ipv6address: ipv6 address obtained from a DHCPv6 server.  ipif-name: Name of the DHCPv6 client interface.</p>	Informational	
	<p>Event description: The ipv6 address obtained from a DHCPv6 server rebinds success  Log Message: The IPv6 address &lt; ipv6address &gt; on interface &lt;ipif-name&gt; rebinds success.</p> <p>Parameters description:  ipv6address: ipv6 address obtained from a DHCPv6 server.  ipif-name: Name of the DHCPv6 client interface..</p>	Informational	
	<p>Event description: The ipv6 address from a DHCPv6 server was deleted.  Log Message: The IPv6 address &lt; ipv6address &gt; on interface &lt;ipif-name&gt; was deleted.</p> <p>Parameters description:  ipv6address: ipv6 address obtained from a DHCPv6 server.  ipif-name: Name of the DHCPv6 client interface.</p>	Informational	
DHCPv6 Relay	<p>Event description: DHCPv6 relay on a specify interface's administrator state changed  Log Message: DHCPv6 relay on interface &lt;ipif-name&gt; changed state to [enabled   disabled]</p> <p>Parameters description:  &lt;ipif-name&gt;: Name of the DHCPv6 relay agent interface.</p>	Informational	
DHCPv6 Server	<p>Event description: The address of the DHCPv6 Server pool is used up  Log Message: The address of the DHCPv6 Server pool &lt;pool-name&gt; is used up.</p> <p>Parameters description:  &lt;pool-name&gt;: Name of the DHCPv6 Server pool.</p>	Informational	
	<p>Event description: The number of allocated ipv6 addresses is equal to 4096  Log Message: The number of allocated ipv6 addresses of the DHCPv6 Server pool is equal to 4096.</p> <p>Parameters description:</p>	Informational	
RCP	<p>Event description: Firmware upgraded successfully.  Log Message: [Unit &lt;unitID&gt;] Firmware upgraded by &lt;session&gt; successfully.  (Username: &lt;username&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;)</p> <p>Parameters description:  unitID: Represent the id of the device in the stacking system.  session: The user's session.  username: Represent current login user.  ipaddr: Represent client IP address.  macaddr : Represent client MAC address.</p>	Informational	

	<p>Event description: Firmware upgrade unsuccessfully.  Log Message: [Unit &lt;unitID&gt;.] Firmware upgrade by &lt;session&gt; unsuccessfully. (Username: &lt;username&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;)</p> <p>Parameters description:  unitID: Represent the id of the device in the stacking system.  session: The user's session.  username: Represent current login user.  ipaddr: Represent client IP address.  macaddr : Represent client MAC address.</p>	Warning	
	<p>Event description: Firmware uploaded successfully.  Log Message: Firmware uploaded by &lt;session&gt; successfully. (Username: &lt;username&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;)</p> <p>Parameters description:  session: The user's session.  username: Represent current login user.  ipaddr: Represent client IP address.  macaddr : Represent client MAC address.</p>	Informational	
	<p>Event description: Firmware upload unsuccessfully.  Log Message: Firmware upload by &lt;session&gt; unsuccessfully. (Username: &lt;username&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;)</p> <p>Parameters description:  session: The user's session.  username: Represent current login user.  ipaddr: Represent client IP address.</p>	Warning	
	<p>Event description: Configuration downloaded successfully.  Log Message: Configuration downloaded by &lt;session&gt; successfully. (Username: &lt;username&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;)</p> <p>Parameters description:  session: The user's session.  username: Represent current login user.  ipaddr: Represent client IP address.  macaddr : Represent client MAC address.</p>	Informational	
	<p>Event description: Configuration download unsuccessfully.  Log Message: Configuration download by &lt;session&gt; unsuccessfully. (Username: &lt;username&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;)</p> <p>Parameters description:  session: The user's session.  username: Represent current login user.  ipaddr: Represent client IP address.  macaddr : Represent client MAC address.</p>	Warning	
	<p>Event description: Configuration uploaded successfully.  Log Message: Configuration uploaded by &lt;session&gt; successfully. (Username: &lt;username&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;)</p> <p>Parameters description:  session: The user's session.  username: Represent current login user.</p>	Informational	

	<p>ipaddr: Represent client IP address. macaddr : Represent client MAC address.</p>		
	<p>Event description: Configuration upload unsuccessfully. Log Message: Configuration upload by &lt;session&gt; unsuccessfully. (Username: &lt;username&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;)</p> <p>Parameters description: session: The user's session. username: Represent current login user. ipaddr: Represent client IP address. macaddr : Represent client MAC address.</p>	Warning	
	<p>Event description: Log message uploaded successfully. Log Message: Log message uploaded by &lt;session&gt; successfully. (Username: &lt;username&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;)</p> <p>Parameters description: session: The user's session. username: Represent current login user. ipaddr: Represent client IP address. macaddr : Represent client MAC address.</p>	Informational	
	<p>Event description: Log message upload unsuccessfully. Log Message: Log message upload by &lt;session&gt; unsuccessfully. (Username: &lt;username&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;)</p> <p>Parameters description: session: The user's session. username: Represent current login user. ipaddr: Represent client IP address. macaddr : Represent client MAC address.</p>	Warning	
	<p>Event description: The downloaded configurations executed successfully. Log Message: The downloaded configurations executed by &lt;session&gt; successfully. (Username: &lt;username&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;)</p> <p>Parameters description: session: The user's session. username: Represent current login user. ipaddr: Represent client IP address. macaddr : Represent client MAC address.</p>	Informational	
	<p>Event description: The downloaded configurations execute unsuccessfully. Log Message: The downloaded configurations executed by &lt;session&gt; unsuccessfully. (Username: &lt;username&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;)</p> <p>Parameters description: session: The user's session. username: Represent current login user. ipaddr: Represent client IP address. macaddr : Represent client MAC address.</p>	Warning

	<p>Event description: 802.1X Authentication successful. Log Message: 802.1X Authentication successful from (Username: &lt;username&gt;, Port: &lt;[unitID:]portNum&gt;, MAC: &lt;macaddr&gt; )</p> <p>Parameters description: username: The user that is being authenticated. unitID: The unit ID. portNum: The switch port number. macaddr: The MAC address of the authenticated device.</p>	Informational	
<b>RADIUS</b>	<p>Event description: VID assigned from RADIUS server after RADIUS client is authenticated by RADIUS server successfully .This VID will be assigned to the port and this port will be the VLAN untagged port member.</p> <p>Log Message: RADIUS server &lt;ipaddr&gt; assigned VID :&lt;vlanID&gt; to port &lt;[unitID:]portNum&gt; (account :&lt;username&gt; )</p> <p>Parameters description:</p>	Informational	

	<p>ipaddr: The IP address of the RADIUS server.      vlanID: The VID of RADIUS assigned VLAN.      unitID: The unit ID.      portNum: The port number.      Username: The user that is being authenticated.</p>		
	<p>Event description: Ingress bandwidth assigned from RADIUS server after RADIUS client is authenticated by RADIUS server successfully .This Ingress bandwidth will be assigned to the port.      Log Message: RADIUS server &lt;ipaddr&gt; assigned ingress bandwidth :&lt;ingressBandwidth&gt; to port &lt;[unitID:]portNum&gt; (account : &lt;username&gt;)</p> <p>Parameters description:      ipaddr: The IP address of the RADIUS server.      ingressBandwidth: The ingress bandwidth of RADIUS assign.      unitID: The unit ID.      portNum: The port number.      Username: The user that is being authenticated.</p>	Informational	
	<p>Event description: Egress bandwidth assigned from RADIUS server after RADIUS client is authenticated by RADIUS server successfully .This egress bandwidth will be assigned to the port.      Log Message: RADIUS server &lt;ipaddr&gt; assigned egress bandwidth :&lt;egressBandwidth&gt; to port &lt;[unitID:]portNum&gt; (account: &lt;username&gt;)</p> <p>Parameters description:      ipaddr: The IP address of the RADIUS server.      egressBandwidth: The egress bandwidth of RADIUS assign.      unitID: The unit ID.      portNum: The port number.      Username: The user that is being authenticated.</p>	Informational	
	<p>Event description: 802.1p default priority assigned from RADIUS server after RADIUS client is authenticated by RADIUS server successfully. This 802.1p default priority will be assigned to the port.      Log Message: RADIUS server &lt;ipaddr&gt; assigned 802.1p default priority:&lt;priority&gt; to port &lt;[unitID:]portNum&gt; (account : &lt;username&gt;)</p> <p>Parameters description:      ipaddr: The IP address of the RADIUS server.      priority: Priority of RADIUS assign.      unitID: The unit ID.      portNum: The port number.      Username: The user that is being authenticated.</p>	Informational	
	<p>Event description: Failed to assign ACL profiles/rules from RADIUS server.      Log Message: RADIUS server &lt;ipaddr&gt; assigns &lt;username&gt; ACL failure at port &lt;[unitID]portNum&gt; (&lt;string&gt;)</p> <p>Parameters description:      ipaddr: The IP address of the RADIUS server.      unitID: The unit ID.      portNum: The port number.      Username: The user that is being authenticated.      string: The failed RADIUS ACL command string.</p>	Warning	

<b>LLDP-MED</b>	<p>Event description: LLDP-MED topology change detected  Log Message: LLDP-MED topology change detected (on port &lt;portNum&gt;, chassis id: &lt;chassisType&gt;, &lt;chassisID&gt;, port id: &lt;portType&gt;, &lt;portID&gt;, device class: &lt;deviceClass&gt;)</p> <p>Parameters description:  portNum: The port number.  chassisType: chassis ID subtype. Voice VLAN	<p>Event description: When a new voice device is detected in the port.  Log Message: New voice device detected (Port &lt;portNum&gt;, MAC &lt;macaddr&gt;)</p> <p>Parameters description:  portNum : The port number.  macaddr: Voice device MAC address</p>	Informational	
	<p>Event description: When a port which is in auto Voice VLAN mode joins the Voice VLAN  Log Message: Port &lt; portNum &gt; add into Voice VLAN &lt;vid &gt;</p> <p>Parameters description:  portNum : The port number.  vid:VLAN ID</p>	Informational	
	<p>Event description: When a port leaves the Voice VLAN and at the same time, no voice device is detected in the aging interval for that port, the log message will be sent.  Log Message: Port &lt; portNum &gt; remove from Voice VLAN &lt;vid &gt;</p> <p>Parameters description:  portNum : The port number.</p>	Informational	

	vid:VLAN ID		
<b>DULD</b>	<p>Event description: A unidirectional link has been detected on this port</p> <p>Log Message: [DULD(1):] port:&lt;[unitID:]&gt;</p> <p>portNum&gt; is unidirectional.</p> <p>Parameters description:</p> <p>unitID: the unit ID</p> <p>portNum: port number</p>	Informational	
<b>Stacking</b>	<p>Event description: Hot insertion.</p> <p>Log Message: Unit: &lt;unitID&gt;, MAC: &lt;macaddr&gt; Hot insertion.</p> <p>Parameters description:</p> <p>unitID: Box ID.</p> <p>Macaddr: MAC address.</p>	Informational	
	<p>Event description: Hot removal.</p> <p>Log Message: Unit: &lt;unitID&gt;, MAC: &lt;macaddr&gt; Hot removal.</p> <p>Parameters description:</p> <p>unitID: Box ID.</p> <p>Macaddr: MAC address.</p>	Informational	
	<p>Event description: Stacking topology change.</p> <p>Log Message: Stacking topology is &lt;Stack_TP_TYPE&gt;. Master(Unit &lt;unitID&gt;, MAC:&lt;macaddr&gt;).</p> <p>Parameters description:</p> <p>Stack_TP_TYPE: The stacking topology type is one of the following:</p> <ol style="list-style-type: none"> <li>1. Ring,</li> <li>2. Chain.</li> </ol> <p>unitID: Box ID.</p> <p>Macaddr: MAC address.</p>	Informational	
	<p>Event description: Backup master changed to master.</p> <p>Log Message: Backup master changed to master. Master (Unit: &lt;unitID&gt;).</p> <p>Parameters description:</p> <p>unitID: Box ID.</p>	Informational	
	<p>Event description: Slave changed to master</p> <p>Log Message: Slave changed to master. Master (Unit: &lt;unitID&gt;).</p> <p>Parameters description:</p> <p>unitID: Box ID.</p>	Informational	
	<p>Event description: Box ID conflict.</p> <p>Log Message: Hot insert failed, box ID conflict: Unit &lt;unitID&gt; conflict (MAC: &lt;macaddr&gt; and MAC: &lt;macaddr&gt;).</p> <p>Parameters description:</p> <p>unitID: Box ID.</p> <p>macaddr: The MAC addresses of the conflicting boxes.</p>	Critical	
<b>SNMP</b>	<p>Event Description: SNMP request received with invalid community string</p> <p>Log Message: SNMP request received from &lt;ipaddr&gt; with invalid community string.</p>	Informational	

	Parameters Description: ipaddr: The IP address.		
Web (SSL)	Event description: Successful login through Web. Log Message: Successful login through Web (Username: <username>, IP: <ipaddr>).  Parameters description: username: The use name that used to login HTTP server. ipaddr: The IP address of HTTP client.	Informational	
	Event description: Login failed through Web. Log Message: Login failed through Web (Username: <username>, IP: <ipaddr>).  Parameters description: username: The use name that used to login HTTP server. ipaddr: The IP address of HTTP client.	Warning	
	Event description: Web session timed out. Log Message: Web session timed out (Username: <username>, IP: <ipaddr>).  Parameters description: username: The use name that used to login HTTP server. ipaddr: The IP address of HTTP client.	Informational	
	Event description: Logout through Web. Log Message: Logout through Web (Username: %S, IP: %S).  Parameters description: username: The use name that used to login HTTP server. ipaddr: The IP address of HTTP client.	Informational	
	Event description: Successful login through Web (SSL). Log Message: Successful login through Web (SSL) (Username: <username>, IP: <ipaddr>).  Parameters description: username: The use name that used to login SSL server. ipaddr: The IP address of SSL client.	Informational	
	Event description: Login failed through Web (SSL). Log Message: Login failed through Web (SSL) (Username: <username>, IP: <ipaddr>).  Parameters description: username: The use name that used to login SSL server. ipaddr: The IP address of SSL client.	Warning	
	Event description: Web (SSL) session timed out. Log Message: Web (SSL) session timed out (Username: <username>, IP: <ipaddr>).  Parameters description: username: The use name that used to login SSL server. ipaddr: The IP address of SSL client.	Information	
	Event description: Logout through Web (SSL). Log Message: Logout through Web (SSL) (Username: <username>, IP:	Information	

	<ipaddr>).  Parameters description: username: The use name that used to login SSL server. ipaddr: The IP address of SSL client.		
<b>Port Security</b>	Event description: Address full on a port Log Message: Port security violation (MAC: < macaddr > on port:: < unitID: portNum >) Parameters description: macaddr: The violation MAC address. unitID: The unit ID. portNum: The port number.	Warning	
<b>Safe Guard</b>	Event description: The host enters the mode of normal. Log Message: Unit< unitID >, Safeguard Engine enters NORMAL mode Parameters description: unitID: The unit ID.	Informational	
	Event description: The host enters the mode of exhausted. Log Message: Unit< unitID >, Safeguard Engine enters EXHAUSTED mode Parameters description: unitID: The unit ID.	Warning	
<b>DoS</b>	Event description: The DOS is possibly snooped. Log Message: Possible spoofing attack from IP: <ipaddr>, MAC: <macaddr>, port: <unitID: portNum> Parameters description: ipaddr: The ip address macaddr: The violation MAC address. unitID: The unit ID. portNum: The port number.	Critical	
	Event Description: The DoS attack is blocked Log Message: <dos_name> is blocked from (IP: <ipaddr> Port: <[unit ID:portNum]>)  Parameters Description: dos_name: The type of DoS attack will be one of the followings ipaddr: IP address of attacker portNum: the attacked port.	Informational	
<b>AAA</b>	Event description: Successful login. Log Message: Successful login through <Console   Telnet   Web (SSL)   SSH>(Username: <username>, IP: <ipaddr   ipv6address>).  Parameters description: ipaddr: IP address. username: user name. ipv6address: IPv6 address.	Informational	
	Event description: Login failed. Log Message: Login failed through <Console   Telnet   Web (SSL)  SSH>(Username: <username>, IP: <ipaddr   ipv6address>).  Parameters description: ipaddr: IP address. username: user name.	Warning	

	ipv6address: IPv6 address.		
	<p>Event description: Logout.  Log Message: Logout through &lt;Console   Telnet   Web (SSL)  SSH&gt;  (Username: &lt;username&gt;, IP: &lt;ipaddr   ipv6address&gt;).</p> <p>Parameters description:  ipaddr: IP address.  username: user name.  ipv6address: IPv6 address.</p>	Informational	
	<p>Event description: session timed out.  Log Message: &lt;Console   Telnet   Web (SSL)  SSH&gt; session timed out  (Username: &lt;username&gt;, IP: &lt;ipaddr   ipv6address&gt;).</p> <p>Parameters description:  ipaddr: IP address.  username: user name.  ipv6address: IPv6 address.</p>	Informational	
	<p>Event description: SSH server is enabled.  Log Message: SSH server is enabled</p>	Informational	
	<p>Event description: SSH server is disabled.  Log Message: SSH server is disabled</p>	Informational	
	<p>Event description: Authentication Policy is enabled.  Log Message: Authentication Policy is enabled (Module: AAA).</p>	Informational	
	<p>Event description: Authentication Policy is disabled.  Log Message: Authentication Policy is disabled (Module: AAA).</p>	Informational	
	<p>Event description: Login failed due to AAA server timeout or improper configuration.  Log Message: Login failed through &lt;Console   Telnet   Web (SSL)  SSH&gt; from &lt;ipaddr   ipv6address&gt; due to AAA server &lt;ipaddr   ipv6address&gt; timeout or improper configuration (Username: &lt;username&gt;).</p> <p>Parameters description:  ipaddr: IP address.  ipv6address: IPv6 address.  username: user name.</p>	Warning	
	<p>Event description: Successful Enable Admin authenticated by AAA local or none or server.  Log Message: Successful Enable Admin through &lt;Console   Telnet   Web (SSL)  SSH&gt; from &lt;ipaddr   ipv6address&gt; authenticated by AAA &lt;local   none   server &lt;ipaddr   ipv6address&gt;&gt; (Username: &lt;username&gt;).</p> <p>Parameters description:  local: enable admin by AAA local method.  none: enable admin by AAA none method.  server: enable admin by AAA server method.  ipaddr: IP address.  ipv6address: IPv6 address.  username: user name.</p>	Informational	
	<p>Event description: Enable Admin failed due to AAA server timeout or improper configuration.  Log Message: Enable Admin failed through &lt;Console   Telnet   Web(SSL)  SSH&gt; from &lt;ipaddr   ipv6address&gt; due to AAA server &lt;ipaddr   ipv6address&gt;</p>	Warning	

	timeout or improper configuration (Username: <username>)  Parameters description: ipaddr: IP address. ipv6address: IPv6 address. username: user name.		
	Event description: Enable Admin failed authenticated by AAA local or server. Log Message: Enable Admin failed through <Console   Telnet   Web (SSL)  SSH> from <ipaddr   ipv6address> authenticated by AAA < local   server <ipaddr   ipv6address>> (Username: <username>).  Parameters description: local: enable admin by AAA local method. server: enable admin by AAA server method. ipaddr: IP address. ipv6address: IPv6 address. username: user name.	Warning	
	Event description: Successful login authenticated by AAA local or none or server. Log Message: Successful login through <Console   Telnet   Web (SSL)   SSH> from < ipaddr   ipv6address > authenticated by AAA <local   none   server <ipaddr   ipv6address>> (Username: <username>).  Parameters description: local: specify AAA local method. none: specify none method. server: specify AAA server method. ipaddr: IP address. ipv6address: IPv6 address. username: user name.	Informational	
	Event description: Login failed authenticated by AAA local or server. Log Message: Login failed through <Console   Telnet   Web (SSL)  SSH> from <ipaddr   ipv6address> authenticated by AAA <local   server <ipaddr   ipv6address>> (Username: <username>).  Parameters description: local: specify AAA local method. server: specify AAA server method. ipaddr: IP address. ipv6address: IPv6 address. username: user name.	Warning	
WAC	Event description: When a client host fails to authenticate. Log Message: WAC unauthenticated user (User Name: <string>, IP: <ipaddr   ipv6address>, MAC: <macaddr>, Port: <[unitID:]portNum>)  Parameters description: string: User name ipaddr: IP address ipv6address: IPv6 address macaddr: MAC address unitID: The unit ID portNum : The port number	Warning	

	<p>Event description: This log will be triggered when the number of authorized users reaches the maximum user limit on the whole device.</p> <p>Log Message: WAC enters stop learning state.</p>	Warning	
	<p>Event description: This log will be triggered when the number of authorized users is below the maximum user limit on whole device in a time interval (5 min).</p> <p>Log Message: WAC recovered from stop learning state.</p>	Warning	
	<p>Event description: When a client host authenticated successful.</p> <p>Log Message: WAC authenticated user (Username: &lt;string&gt;, IP: &lt;ipaddr   ipv6address&gt;, MAC: &lt;macaddr&gt;, Port: &lt;[unitID:] portNum&gt;)</p> <p>Parameters description:</p> <p>string: User name ipaddr: IP address ipv6address: IPv6 address macaddr: MAC address unitID: The unit ID portNum : The port number</p>	Informational	
JWAC	<p>Event description: When a client host authenticated successful.</p> <p>Log Message: JWAC authenticated user (Username: &lt;string&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;, Port: &lt;[unitID:]portNum&gt;)</p> <p>Parameters description:</p> <p>string: Username ipaddr: IP address macaddr: MAC address unitID: The unit ID portNum : The port number</p>	Informational	
	<p>Event description: When a client host fails to authenticate.</p> <p>Log Message: JWAC unauthenticated user (User Name: &lt;string&gt;, IP: &lt;ipaddr&gt;, MAC: &lt;macaddr&gt;, Port: &lt;[unitID:]portNum&gt;)</p> <p>Parameters description:</p> <p>string: User name ipaddr: IP address macaddr: MAC address unitID: The unit ID portNum : The port number</p>	Warning	
	<p>Event description: This log will be triggered when the number of authorized users reaches the maximum user limit on the whole device.</p> <p>Log Message: JWAC enters stop learning state.</p>	Warning

	Event description: Spanning Tree Protocol is disabled Log Message: Spanning Tree Protocol is disabled	Informational	
	Event description: New root port Log Message: New root port selected [( [Instance:<InstanceID> ], port:<[unitID:] portNum>)]  Parameters description: InstanceID: Instance ID. portNum:Port ID	Notice	
	Event description: Spanning Tree port status changed Log Message: Spanning Tree port status changed [( [Instance:<InstanceID> ], port:<[unitID:] portNum>)] <old_status> -> <new_status>  Parameters description: InstanceID: Instance ID. portNum: Port ID old_status: Old status new_status: New status	Notice	
	Event description: Spanning Tree port role changed. Log Message: Spanning Tree port status changed. [( [Instance:<InstanceID> ], port:<[unitID:] portNum>)] <old_role> -> <new_role>  Parameters description: InstanceID: Instance ID. portNum:Port ID/ old_role: Old role new_status:New role	Informational	
	Event description: Spanning Tree instance created. Log Message: Spanning Tree instance created. Instance:<InstanceID>  Parameters description:	Informational	

	InstanceID: Instance ID.		
	<p>Event description: Spanning Tree instance deleted.  Log Message: Spanning Tree instance deleted. Instance:&lt;InstanceID&gt;</p> <p>Parameters description:  InstanceID: Instance ID.</p>	Informational	
	<p>Event description: Spanning Tree Version changed.  Log Message: Spanning Tree version changed. New version:&lt;new_version&gt;</p> <p>Parameters description:  new_version: New STP version.</p>	Informational	
	<p>Event description: Spanning Tree MST configuration ID name and revision level changed.  Log Message: Spanning Tree MST configuration ID name and revision level changed (name:&lt;name&gt;, revision level &lt;revision_level&gt;).</p> <p>Parameters description:  name : New name.  revision_level: New revision level.</p>	Informational	
	<p>Event description: Spanning Tree MST configuration ID VLAN mapping table deleted.  Log Message: Spanning Tree MST configuration ID VLAN mapping table changed (instance: &lt;InstanceID&gt; delete vlan &lt;startvlanid&gt; [- &lt;endvlanid&gt;]).</p> <p>Parameters description:  InstanceID: Instance ID.  startvlanid- endvlanid:VLANlist</p>	Informational	
	<p>Event description: Spanning Tree MST configuration ID VLAN mapping table added.  Log Message: Spanning Tree MST configuration ID VLAN mapping table changed (instance: &lt;InstanceID&gt; add vlan &lt;startvlanid&gt; [- &lt;endvlanid&gt;]).</p> <p>Parameters description:  InstanceID: Instance ID.  startvlanid- endvlanid:VLANlist</p>	Informational	
CFM	<p>Event description: Cross-connect is detected  Log Message: CFM cross-connect. VLAN:&lt;vlanid&gt;, Local(MD Level:&lt;mdlevel&gt;, Port &lt;[unitID:]portNum&gt;, Direction:&lt;mepdirection&gt;) Remote(MEPID:&lt;mepid&gt;, MAC:&lt;macaddr&gt;)</p> <p>Parameters description:  vlanid: Represents the VLAN identifier of the MEP.  mdlevel: Represents the MD level of the MEP.  unitID: Represents the ID of the device in the stacking system.  portNum: Represents the logical port number of the MEP.  mepdirection: Can be "inward" or "outward".  mepid: Represents the MEPID of the MEP.  macaddr: Represents the MAC address of the MEP.</p>	Critical	
	<p>Event description: Error CFM CCM packet is detected  Log Message: MD Level:&lt;mdlevel&gt;, VLAN:&lt;vlanid&gt;, Local(Port &lt;[unitID:]portNum&gt;, Direction:&lt;mepdirection&gt;) Remote(MEPID:&lt;mepid&gt;, MAC:&lt;macaddr&gt;)</p>	Warning	

	<p>Parameters description:</p> <p>vlanid: Represents the VLAN identifier of the MEP.</p> <p>mdlevel: Represents MD level of the MEP.</p> <p>unitID: Represents the ID of the device in the stacking system.</p> <p>portNum: Represents the logical port number of the MEP.</p> <p>mepdirection: Can be "inward" or "outward".</p> <p>mepid: Represents the MEPID of the MEP.</p> <p>macaddr: Represents the MAC address of the MEP.</p>		
	<p>Event description: Cannot receive the remote MEP's CCM packet</p> <p>Log Message: CFM remote down. MD Level:&lt;mdlevel&gt;, VLAN:&lt;vlanid&gt;, Local(Port &lt;[unitID:]portNum&gt;, Direction:&lt;mepdirection&gt;)</p> <p>Parameters description:</p> <p>vlanid: Represents the VLAN identifier of the MEP.</p> <p>mdlevel: Represents the MD level of the MEP.</p> <p>unitID: Represents the ID of the device in the stacking system.</p> <p>portNum: Represents the logical port number of the MEP.</p> <p>mepdirection: Represents the MEP direction, which can be "inward" or "outward" ..</p>	Warning	
	<p>Event description: Remote MEP's MAC reports an error status</p> <p>Log Message: CFM remote MAC error. MD Level:&lt;mdlevel&gt;, VLAN:&lt;vlanid&gt;, Local(Port &lt;[unitID:]portNum&gt;, Direction:&lt;mepdirection&gt;)</p> <p>Parameters description:</p> <p>vlanid: Represents the VLAN identifier of the MEP.</p> <p>mdlevel: Represents the MD level of the MEP.</p> <p>unitID: Represents the ID of the device in the stacking system.</p> <p>portNum: Represents the logical port number of the MEP.</p> <p>mepdirection: Represents the MEP direction, which can be "inward" or "outward".</p>	Warning	
	<p>Event description: Remote MEP detects CFM defects</p> <p>Log Message: CFM remote detects a defect. MD Level:&lt;mdlevel&gt;, VLAN:&lt;vlanid&gt;, Local(Port &lt;[unitID:]portNum&gt;, Direction:&lt;mepdirection&gt;)</p> <p>Parameters description:</p> <p>vlanid: Represents the VLAN identifier of the MEP.</p> <p>mdlevel: Represents the MD level of the MEP.</p> <p>unitID: Represents the ID of the device in the stacking system.</p> <p>portNum: Represents the logical port number of the MEP.</p> <p>mepdirection: Represents the MEP direction, which can be "inward" or "outward".</p>	Informational	
<b>CFM Extension</b>	<p>Event description: AIS condition detected</p> <p>Log Message: [CFM_EXT(1):]AIS condition detected. MD Level:&lt;mdlevel&gt;, VLAN:&lt;vlanid&gt;, Local(Port &lt;[unitID:]portNum&gt;, Direction:&lt;mepdirection&gt;, MEPID:&lt;mepid&gt;)</p> <p>Parameters description:</p> <p>vlanid: Represents the VLAN identifier of the MEP.</p> <p>mdlevel: Represents the MD level of the MEP.</p> <p>unitID: Represents the ID of the device in the stacking system.</p> <p>portNum: Represents the logical port number of the MEP.</p> <p>mepdirection: Represents the direction of the MEP. This can be "inward" or</p>	Notice	

	<p>"outward".</p> <p>mepid: Represents the MEPID of the MEP.</p>		
	<p>Event description: AIS condition cleared</p> <p>Log Message: [CFM_EXT(2):]AIS condition cleared. MD Level:&lt;mdlevel&gt;, VLAN:&lt;vlanid&gt;, Local(Port &lt;[unitID:]portNum&gt;, Direction:&lt;mepdirection&gt;, MEPID:&lt;mepid&gt;)</p> <p>Parameters description:</p> <p>vlanid: Represents the VLAN identifier of the MEP.</p> <p>mdlevel: Represents the MD level of the MEP.</p> <p>unitID: Represents the ID of the device in the stacking system.</p> <p>portNum: Represents the logical port number of the MEP.</p> <p>mepdirection: Represents the direction of the MEP. This can be "inward" or "outward".</p> <p>mepid: Represents the MEPID of the MEP.</p>	Notice	
	<p>Event description: LCK condition detected</p> <p>Log Message: [CFM_EXT(3):]LCK condition detected. MD Level:&lt;mdlevel&gt;, VLAN:&lt;vlanid&gt;, Local(Port &lt;[unitID:]portNum&gt;, Direction:&lt;mepdirection&gt;, MEPID:&lt;mepid&gt;)</p> <p>Parameters description:</p> <p>vlanid: Represents the VLAN identifier of the MEP.</p> <p>mdlevel: Represents the MD level of the MEP.</p> <p>unitID: Represents the ID of the device in the stacking system.</p> <p>portNum: Represents the logical port number of the MEP.</p> <p>mepdirection: Represents the direction of the MEP. This can be "inward" or "outward".</p> <p>mepid: Represents the MEPID of the MEP.</p>	Notice	
	<p>Event description: LCK condition cleared</p> <p>Log Message: [CFM_EXT(4):]LCK condition cleared. MD Level:&lt;mdlevel&gt;, VLAN:&lt;vlanid&gt;, Local(Port &lt;[unitID:]portNum&gt;, Direction:&lt;mepdirection&gt;, MEPID:&lt;mepid&gt;)</p> <p>Parameters description:</p> <p>vlanid: Represents the VLAN identifier of the MEP.</p> <p>mdlevel: Represents the MD level of the MEP.</p> <p>unitID: Represents the ID of the device in the stacking system.</p> <p>portNum: Represents the logical port number of the MEP.</p> <p>mepdirection: Represents the direction of the MEP. This can be "inward" or "outward".</p> <p>mepid: Represents the MEPID of the MEP.</p>	Notice	
DDM	<p>Event description: DDM exceeded or recover from DDM alarm threshold</p> <p>Log Message: DDM Port &lt;[unitID:]portNum&gt; optic module [thresholdType] [exceedType] the [thresholdSubType] alarm threshold</p> <p>Parameters description:</p> <p>unitID: The unit ID.</p> <p>portNum: The port number.</p> <p>thresholdType: the DDM threshold type. The value should be one of the following values: temperature, supply voltage, bias current, TX power, RX power.</p> <p>exceedType: indicate exceed threshold or recover to normal event, the value should be "recovered from" or "exceeded"</p> <p>thresholdSubType: the DDM threshold sub type, the value should be "high" or</p>	Critical	

	"low".		
	<p>Event description: DDM exceeded or recover from DDM warning threshold  Log Message: DDM Port &lt;[unitID:]portNum&gt; optic module [thresholdType] [exceedType] the [thresholdSubType] warning threshold</p> <p>Parameters description:  unitID: The unit ID.  portNum: The port number.  thresholdType: the DDM threshold type. The value should be one of the following values: temperature, supply voltage, bias current, TX power, RX power.  exceedType: indicate exceed threshold or recover to normal event, the value should be "recovered from" or "exceeded"  thresholdSubType: the DDM threshold sub type, the value should be "high" or "low".</p>	Warning	
<b>IP and Password</b>	<p>Event description: Password change activity  Log Message: Unit &lt;unitID&gt;, Password was changed by [console] (Username: &lt;username&gt;[, IP: &lt;ipaddr&gt;])</p> <p>Parameters description:  unitID: Represents the unit ID  username: Represents user name.  ipaddr: Represents IP address.</p>	Informational	The string "[console]" is just for console session. The string "[, IP: <ipaddr>]" is not for console session.
	<p>Event description: System IP address change activity  Log Message: Unit &lt;unitID&gt;, Management IP address was changed by [console] (Username: &lt;username&gt;[, IP: &lt;ipaddr&gt;])</p> <p>Parameters description:  unitID: Represents the unit ID  username: Represents user name.  ipaddr: Represents IP address.</p>	Informational	The string "[console]" is just for console session. The string "[, IP: <ipaddr>]" is not for console session.
<b>Link Aggregation</b>	<p>Event Description: Link aggregation Group link change.  Log Message: Link aggregation Group &lt;Group ID&gt; (Interface: &lt;ifIndex&gt;) &lt;link status&gt;.</p> <p>Parameters Description:  Group ID: Link Aggregation Group ID.  ifIndex: The interface index of the link aggregation group which link state was link changed.  Link status: link status.  Value list:  1. link up: The first member port of group link up.  2. link down: The last member port of group link down.</p>	Informational	
<b>SSH</b>	<p>Event description: Successful login through SSH.  Log Message: Successful login through &lt;Console   Telnet   Web   SSH&gt;(Username: &lt;username&gt;, IP: &lt;ipaddr   ipv6address&gt;).</p> <p>Parameters description:  ipaddr: IP address.  username: user name.  ipv6address: IPv6 address.</p>	Informational	
	<p>Event description: Login failed through SSH.  Log Message: Login failed through &lt;Console   Telnet   Web   SSH&gt;</p>	Warning	

	(Username: <username>, IP: <ipaddr   ipv6address>).  Parameters description: ipaddr: IP address. username: user name. ipv6address: IPv6 address.		
	Event description: Logout through SSH.  Log Message: Logout through <Console   Telnet   Web   SSH> (Username: <username>, IP: <ipaddr   ipv6address>).  Parameters description: ipaddr: IP address. username: user name. ipv6address: IPv6 address.	Informational	
	Event description: SSH session timed out.  Log Message: <Console   Telnet   Web   SSH> session timed out (Username: <username>, IP: <ipaddr   ipv6address>).  Parameters description: ipaddr: IP address. username: user name. ipv6address: IPv6 address.	Informational	
	Event description: SSH server is enabled.  Log Message: SSH server is enabled	Informational	
	Event description: SSH server is disabled.  Log Message: SSH server is disabled	Informational	
	Event description: Login failed through SSH due to AAA server timeout or improper configuration.  Log Message: Login failed through <Console   Telnet   Web   SSH> from <ipaddr   ipv6address> due to AAA server <ipaddr   ipv6address> timeout or improper configuration (Username: <username>).  Parameters description: ipaddr: IP address. ipv6address: IPv6 address. username: user name.	Warning	
	Event description: Enable Admin failed through SSH due to AAA server timeout or improper configuration.  Log Message: Enable Admin failed through <Console   Telnet   Web   SSH> from <ipaddr   ipv6address> due to AAA server <ipaddr   ipv6address> timeout or improper configuration (Username: <username>)  Parameters description: ipaddr: IP address. ipv6address: IPv6 address. username: user name.	Warning	
	Event description: Enable Admin failed through SSH authenticated by AAA local or server.  Log Message: Enable Admin failed through <Console   Telnet   Web   SSH> from <ipaddr   ipv6address> authenticated by AAA < local   server <ipaddr   ipv6address>> (Username: <username>).  Parameters description:	Warning	

	local: enable admin by AAA local method. server: enable admin by AAA server method. ipaddr: IP address. ipv6address: IPv6 address. username: user name.		
	<p>Event description: Successful Enable Admin through SSH authenticated by AAA local or none or server.</p> <p>Log Message: Successful Enable Admin through &lt;Console   Telnet   Web   SSH&gt; from &lt;ipaddr   ipv6address&gt; authenticated by AAA &lt;local   none   server &lt;ipaddr   ipv6address&gt;&gt; (Username: &lt;username&gt;).</p> <p>Parameters description:</p> <p>local: enable admin by AAA local method.</p> <p>none: enable admin by AAA none method.</p> <p>server: enable admin by AAA server method.</p> <p>ipaddr: IP address.</p> <p>ipv6address: IPv6 address.</p> <p>username: user name.</p>	Informational	
	<p>Event description: Login failed through SSH authenticated by AAA local or server.</p> <p>Log Message: Login failed through &lt;Console   Telnet   Web   SSH&gt; from &lt;ipaddr   ipv6address&gt; authenticated by AAA &lt;local   server &lt;ipaddr   ipv6address&gt;&gt; (Username: &lt;username&gt;).</p> <p>Parameters description:</p> <p>local: specify AAA local method.</p> <p>server: specify AAA server method.</p> <p>ipaddr: IP address.</p> <p>ipv6address: IPv6 address.</p> <p>username: user name.</p>	Warning	
	<p>Event description: Successful login through SSH authenticated by AAA local or none or server.</p> <p>Log Message: Successful login through &lt;Console   Telnet   Web   SSH&gt; from &lt;ipaddr   ipv6address&gt; authenticated by AAA &lt;local   none   server &lt;ipaddr   ipv6address&gt;&gt; (Username: &lt;username&gt;).</p> <p>Parameters description:</p> <p>local: specify AAA local method.</p> <p>none: specify none method.</p> <p>server: specify AAA server method.</p> <p>ipaddr: IP address.</p> <p>ipv6address: IPv6 address.</p> <p>username: user name.</p>	Informational	
	<p>Event description: Successfully download client public keys.</p> <p>Log Message: SSH client public keys file was upgraded successfully (Username: &lt;username&gt;, IP: &lt;ipaddr   ipv6address&gt;)</p> <p>Parameters description:</p> <p>username: The username upgraded client public keys file.</p> <p>ipaddr: The IP address of the public keys file server.</p> <p>ipv6address: The IP address of the public keys file server.</p>	Informational	
RIPng	<p>Event description: The RIPng state of interface changed</p> <p>Log Message: [RIPng(1):]RIPng protocol on interface &lt;intf-name&gt; changed</p>	Informational	

	state to <enabled   disabled> Parameters description: intf-name: Interface name.		
<b>BPDU Attack Protection</b>	Event Description: Link aggregation Group link change. Log Message: Link aggregation Group <Group ID> (Interface: <ifIndex>) <link status>.  Parameters Description: Group ID: Link Aggregation Group ID. ifIndex: The interface index of the link aggregation group which link state was link changed. Link status: link status. Value list: 1. link up: The first member port of group link up. 2. link down: The last member port of group link down.	Informational	
	Event description: BPDU attack happened. Log Message: Port<[unitID:]portNum> enter BPDU under protection state (mode: drop / block / shutdown)  Parameters description: unitID: The unit ID. portNum: The port number. mode: The BPDU current state	Informational	
	Event description: BPDU attack automatically recover. Log Message: Port <[unitID:]portNum> recover from BPDU under protection state automatically  Parameters description: unitID: The unit ID. portNum: The port number.	Informational	
	Event description: BPDU attack manually recover. Log Message: Port<[unitID:]portNum> recover from BPDU under protection state automatically  Parameters description: unitID: The unit ID. portNum: The port number. severity: informational	Informational	

## Appendix C - Trap Entries

This table lists the trap logs found on the Switch.

Category	Trap Name	Description	OID
<b>MAC-based Access Control</b>	SwMacBasedAccessControlLoggedSuccess	The trap is sent when a MAC-based Access Control host is successfully logged in. Binding objects: (1) swMacBasedAuthInfoMacIndex (2) swMacBasedAuthInfoPortIndex (3) swMacBasedAuthVID	1.3.6.1.4.1.171.12.35.11.1.0 .1
	SwMacBasedAccessControlLoggedFail	The trap is sent when a MAC-based Access Control host login fails. Binding objects: (1) swMacBasedAuthInfoMacIndex (2) swMacBasedAuthInfoPortIndex (3) swMacBasedAuthVID	1.3.6.1.4.1.171.12.35.11.1.0 .2
	SwMacBasedAccessControlAgesOut	The trap is sent when a MAC-based Access Control host ages out. Binding objects: (1) swMacBasedAuthInfoMacIndex (2) swMacBasedAuthInfoPortIndex (3) swMacBasedAuthVID	1.3.6.1.4.1.171.12.35.11.1.0 .3
<b>LLDP</b>	IldpRemTablesChange	A IldpRemTablesChange notification is sent when the value of IldpStatsRemTableLastChangeTime changes. Binding objects: (1) IldpStatsRemTablesInserts (2) IldpStatsRemTablesDeletes (3) IldpStatsRemTablesDrops (4) IldpStatsRemTablesAgeouts	1.0.8802.1.1.2.0.0.1
<b>LLDP-MED</b>	IldpXMedTopologyChangeDetected	A notification generated by the local device sensing a change in the topology that indicates that a new remote device attached to a local port, or a remote device disconnected or moved from one port to another. Binding objects: (1) IldpRemChassisIdSubtype (2) IldpRemChassisId (3) IldpXMedRemDeviceClass	1.0.8808.1.1.2.1.5.4795.0.1
<b>802.3ah OAM</b>	dot3OamThresholdEvent	This notification is sent when a local or remote threshold crossing event is detected. Binding objects: (1).dot3OamEventLogTimestamp (2).dot3OamEventLogOui (3).dot3OamEventLogType (4).dot3OamEventLogLocation (5).dot3OamEventLogWindowHi (6).dot3OamEventLogWindowLo (7).dot3OamEventLogThresholdHi (8).dot3OamEventLogThresholdLo (9).dot3OamEventLogValue (10).dot3OamEventLogRunningTotal (11).dot3OamEventLogEventTotal	1.3.6.1.2.1.158.0.1
	dot3OamNonThresholdEvent	This notification is sent when a local or remote non-threshold crossing event is detected. Binding objects: (1).dot3OamEventLogTimestamp (2).dot3OamEventLogOui (3).dot3OamEventLogType (4).dot3OamEventLogLocation (5).dot3OamEventLogEventTotal	1.3.6.1.2.1.158.0.2
<b>Upload/Download</b>	agentFirmwareUpgrade	This trap is sent when the process of upgrading the firmware via SNMP has finished. Binding objects:	1.3.6.1.4.1.171.12.1.7.2.0.7

		(1) swMultImageVersion	
	agentCfgOperCompleteTrap	The trap is sent when the configuration is completely saved, uploaded or downloaded Binding objects: unitID agentCfgOperate agentLoginUserName	1.3.6.1.4.1.171.12.1.7.2.0.9
<b>Gratuitous ARP</b>	agentGratuitousARPTrap	The trap is sent when IP address conflicted. Binding objects: (1) ipaddr (2) macaddr (3) portNumber (4) agentGratuitousARPIfaceName	1.3.6.1.4.1.171.12.1.7.2.0.5
<b>Stacking</b>	swUnitInsert	Unit Hot Insert notification.  Binding objects: (1) swUnitMgmtId. (2) swUnitMgmtMacAddr.	1.3.6.1.4.1.171.12.11.2.2.1.0.1
	swUnitRemove	Unit Hot Remove notification.  Binding objects: (1) swUnitMgmtId. (2) swUnitMgmtMacAddr.	1.3.6.1.4.1.171.12.11.2.2.1.0.2
	swUnitFailure	Unit Failure notification.  Binding objects: (1) swUnitMgmtId.	1.3.6.1.4.1.171.12.11.2.2.1.0.3
	swUnitTPChange	The stacking topology change notification.  Binding objects: (1) swStackTopologyType (2) swUnitMgmtId (3) swUnitMgmtMacAddr	1.3.6.1.4.1.171.12.11.2.2.1.0.4
	swUnitRoleChange	The stacking unit role change notification.  Binding objects: (1) swStackRoleType (2) swUnitMgmtId	1.3.6.1.4.1.171.12.11.2.2.1.0.5
<b>Port Security</b>	swL2PortSecurityViolationTrap	When the port security trap is enabled, new MAC addresses that violate the pre-defined port security configuration will trigger trap messages to be sent out.  Binding objects: (1) swPortSecPortIndex (2) swL2PortSecurityViolationMac	1.3.6.1.4.1.171.11.119.X.2.1 00.1.2.0.2,(X:module ID)
<b>Safe Guard</b>	swSafeGuardChgToNormal	This trap indicates system change operation mode from exhausted to normal.  Binding objects: (1) swSafeGuardCurrentStatus	1.3.6.1.4.1.171.12.19.4.1.0.2
	swSafeGuardChgToExhausted	This trap indicates System change operation mode from normal to exhausted.  Binding objects: (1) swSafeGuardCurrentStatus	1.3.6.1.4.1.171.12.19.4.1.0.1
<b>LBD</b>	swPortLoopOccurred	The trap is sent when a port loop occurs.  Binding objects: (1) swLoopDetectPortIndex	1.3.6.1.4.1.171.12.41.10.0.1
	swPortLoopRestart	The trap is sent when a port loop restarts after the interval time.  Binding objects: (1) swLoopDetectPortIndex	1.3.6.1.4.1.171.12.41.10.0.2

	swVlanLoopOccurred	The trap is sent when a port loop occurs under LBD VLAN-based mode.  Binding objects: (1) swLoopDetectPortIndex (2) swVlanLoopDetectVID	1.3.6.1.4.1.171.12.41.10.0.3
	swVlanLoopRestart	The trap is sent when a port loop restarts under LBD VLAN-based mode after the interval time.  Binding objects: (1) swLoopDetectPortIndex (2) swVlanLoopDetectVID	1.3.6.1.4.1.171.12.41.10.0.4
<b>BPDU Attack Protection</b>	swBpduProtectionUnderAttackingTrap	BPDU attack happened, enter drop / block / shutdown mode. Binding objects: (1) swBpduProtectionPortIndex (2) swBpduProtectionPortMode	1.3.6.1.4.1.171.12.76.4.0.1
	swBpduProtectionRecoveryTrap	BPDU attack automatically recover Binding objects: (1) swBpduProtectionPortIndex (2) swBpduProtectionRecoveryMethod	1.3.6.1.4.1.171.12.76.4.0.2
<b>IMPB</b>	swlpMacBindingViolationTrap	When the IP-MAC Binding trap is enabled, if there's a new MAC that violates the pre-defined port security configuration, a trap will be sent out.  Binding objects: (1) swlpMacBindingPortIndex (2) swlpMacBindingViolationIP (3) swlpMacBindingViolationMac	1.3.6.1.4.1.171.12.23.5.0.1
	swlpMacBindingIPv6ViolationTrap	When the IP-MAC Binding trap is enabled, if there's a new MAC that violates the pre-defined IPv6 IP-MAC Binding configuration, a trap will be sent out.  Binding objects: (1) swlpMacBindingPortIndex (2) swlpMacBindingViolationIPv6Addr (3) swlpMacBindingViolationMac	1.3.6.1.4.1.171.12.23.5.0.4
<b>DHCP Server Screening</b>	swFilterDetectedTrap	Send trap when an illegal DHCP server is detected. The same illegal DHCP server IP address detected is just sent once to the trap receivers within the log ceasing unauthorized duration.  Binding objects: (1) swFilterDetectedIP (2) swFilterDetectedport	1.3.6.1.4.1.171.12.37.100.0.1
	swFilterDHCPv6ServerDetectedTrap	Send trap when an illegal DHCPv6 server is detected.  Binding objects: (1) swFilterDetectedIPv6 (2) swFilterDetectedport	1.3.6.1.4.1.171.12.37.100.0.2
	swFilterICMPv6RaAllNodesDetectedTrap	Send trap when an illegal ICMPv6 all-nodes RA is detected.  Binding objects: (1) swFilterDetectedIPv6 (2) swFilterDetectedport	1.3.6.1.4.1.171.12.37.100.0.3
<b>Traffic Control</b>	swPktStormOccurred	When packet storm is detected by packet storm mechanism.  Binding objects: swPktStormCtrlPortIndex swPktStormNotifyPktType	1.3.6.1.4.1.171.12.25.5.0.1
	swPktStormCleared	When the packet storm is clear.	1.3.6.1.4.1.171.12.25.5.0.2

		Binding objects: swPktStormCtrlPortIndex swPktStormNotifyPktType	
	swPktStormDisablePort	When the port is disabled by the packet storm mechanism.  Binding objects: swPktStormCtrlPortIndex swPktStormNotifyPktType	1.3.6.1.4.1.171.12.25.5.0.3
<b>ERPS</b>	swERPSSFDetectedTrap	Signal fail detected on node.  Binding objects: (1) swERPSNodeld	1.3.6.1.4.1.171.12.78.4.0.1
	swERPSSFClearedTrap	Signal fail cleared on node.  Binding objects: (1) swERPSNodeld	1.3.6.1.4.1.171.12.78.4.0.2
	swERPSRPLOwnerConflictTrap	RPL owner conflicted on the ring.  Binding objects: (1) swERPSNodeld	1.3.6.1.4.1.171.12.78.4.0.3
<b>MSTP</b>	newRoot	The newRoot trap indicates that the sending agent has become the new root of the Spanning Tree; the trap is sent by a bridge soon after its election as the new root, e.g., upon expiration of the Topology Change Timer, immediately subsequent to its election. Implementation of this trap is optional.	1.3.6.1.2.1.17.0.1
	topologyChange	A topologyChange trap is sent by a bridge when any of its configured ports transitions from the Learning state to the Forwarding state, or from the Forwarding state to the Blocking state. The trap is not sent if a newRoot trap is sent for the same transition. Implementation of this trap is optional	1.3.6.1.2.1.17.0.2
<b>CFM</b>	dot1agCfmFaultAlarm	This trap is initiated when a connectivity defect is detected.  Binding objects: (1) dot1agCfmMdIndex (2) dot1agCfmMaIndex (3) dot1agCfmMepIdentifier	1.3.111.2.802.1.1.8.0.1
<b>CFM Extension</b>	swCFMExtAISOccurred	A notification is generated when local MEP enters AIS status.  Binding objects: (1) dot1agCfmMdIndex (2) dot1agCfmMaIndex (3) dot1agCfmMepIdentifier	1.3.6.1.4.1.171.12.86.100.0.1
	swCFMExtAISCleared	A notification is generated when local MEP exits AIS status.  Binding objects: (1) dot1agCfmMdIndex (2) dot1agCfmMaIndex (3) dot1agCfmMepIdentifier	1.3.6.1.4.1.171.12.86.100.0.2
	SwCFMExtLockOccurred	A notification is generated when local MEP enters lock status.  Binding objects: (1) dot1agCfmMdIndex (2) dot1agCfmMaIndex (3) dot1agCfmMepIdentifier	1.3.6.1.4.1.171.12.86.100.0.3
	swCFMExtLockCleared	A notification is generated when local MEP exits lock status.	1.3.6.1.4.1.171.12.86.100.0.4

		Binding objects: (1) dot1agCfmMdIndex (2) dot1agCfmMaIndex (3) dot1agCfmMepIdentifier	
<b>Port</b>	linkup	A notification is generated when port linkup.  Binding objects: (1) ifIndex, (2) if AdminStatus (3) ifOperStatus	1.3.6.1.6.3.1.1.5.4
	linkDown	A notification is generated when port linkdown.  Binding objects: (1) ifIndex, (2) if AdminStatus (3) ifOperStatus	1.3.6.1.6.3.1.1.5.3
<b>DDM</b>	swDdmAlarmTrap	The trap is sent when any parameter value exceeds the alarm threshold value or recovers to normal status depending on the configuration of the trap action.  Binding objects: (1) swDdmPort (2) swDdmThresholdType (3) swDdmThresholdExceedType (4) swDdmThresholdExceedOrRecover	1.3.6.1.4.1.171.12.72.4.0.1
	swDdmWarningTrap	The trap is sent when any parameter value exceeds the warning threshold value or recovers to normal status depending on the configuration of the trap action.  Binding objects: (1) swDdmPort (2) swDdmThresholdType (3) swDdmThresholdExceedType (4) swDdmThresholdExceedOrRecover	1.3.6.1.4.1.171.12.72.4.0.2
<b>MAC Notification</b>	swL2macNotification	This trap indicates the MAC addresses variation in address table  Binding objects: (1) swL2macNotifyInfo	1.3.6.1.4.1.171.11.119.X.2.1 00.1.2.0.1 (X: model ID)
<b>DOS Attack Prevention</b>	swDoSAttackDetected	This trap is sent when the specific DoS packet is received and trap is enabled.  Binding objects: (1) swDoSCtrlType (2) swDoSNotifyVarIpAddr (3) swDoSNotifyVarPortNumber	1.3.6.1.4.1.171.12.59.4.0.1
<b>SNMP</b>	authenticationFailure	An authenticationFailure trap signifies that the SNMP entity has received a protocol message that is not properly authenticated. While all implementations of SNMP entities MAY be capable of generating this trap, the snmpEnableAuthenTraps object indicates whether this trap will be generated.	1.3.6.1.6.3.1.1.5.5
