Boot ROMs

Boot ROMs

For Desktop Adapters

The boot ROMs are options to be installed on the network adapter's on-board remote boot socket. They contain boot programs that permit diskless workstations to boot from a boot server. Network administrators can set up a network security scheme by pre-defining a password, a boot volume and the boot volume's content for each workstation. The boot ROMs support remote boots from servers running NetWare, OS/2, Windows NT and others.
